Washington, D C

MAY 1977

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, at the price code E02 (\$4 75 domestic, \$9 50 foreign).

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971. Since that time, monthly supplements have been issued.

This supplement to *Aeronautical Engineering -- A Special Bibliography* (NASA SP-7037) lists 360 reports, journal articles, and other documents originally announced in April 1977 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A77-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc (AIAA), as follows. Paper copies are available at \$5 00 per document up to a maximum of 20 pages. The charge for each additional page is 25 cents. Microfiche⁽¹⁾ are available at the rate of \$1 50 per microfiche for documents identified by the # symbol following the accession number. A number of publications, because of their special characteristics, are available only for reference in the AIAA Technical Information Service Library. Minimum airmail postage to foreign countries is \$1 00. Please refer to the accession number, e.g., (A77-10026), when requesting publications.

STAR ENTRIES (N77-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail NTIS Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code followed by the letters HC or MF in the *STAR* citation. Price codes are given in the tables on page vii of the current issue of *STAR*.

Microfiche⁽¹⁾ is available regardless of age for those accessions followed by a # symbol.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Unit.

NOTE ON ORDERING DOCUMENTS When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail SOD (or GPO) Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$3 00 price, for those documents identified by a # symbol.)

Avail NASA Public Document Rooms Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

- Avail ERDA Depository Libraries Organizations in U S cities and abroad that maintain collections of Energy Research and Development Administration reports, usually in microfiche form, are listed in *Nuclear Science Abstracts* Services available from the ERDA and its depositories are described in a booklet, *Science Information Available from the Energy Research and Development Administration* (TID-4550), which may be obtained without charge from the ERDA Technical Information Center
- Avail Univ Microfilms Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm All requests should cite the author and the Order Number as they appear in the citation
- Avail USGS Originals of many reports from the U S Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction
- Avail HMSO Publications of Her Majesty s Stationery Office are sold in the U S by Pendragon House Inc (PHI), Redwood City, California The U S price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI
- Avail BLL (formerly NLL) British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England Photocopies available from this organization at the price shown (If none is given, inquiry should be addressed to the BLL)
- Avail ZLDI Sold by the Zentralstelle fur Luftfahrtokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM)
- Avail Issuing Activity, or Corporate Author, or no indication of availability Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document
- Avail U S Patent Office Sold by Commissioner of Patents, U S Patent Office, at the standard price of 50 cents each, postage free
- Other availabilities If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the monthly supplements is \$45.00 domestic, \$75.00 foreign. All questions relating to the subscriptions should be referred to NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield Virginia 22161.

NASA ACCESSION NUMBER	N77-10048#	
TITLE	Lockheed Missiles and Space Co., Sunnyvale, Calif Research and Development Div CIVIL USES OF REMOTELY PILOTED AIRCRAFT Summary Report	CORPORATE SOURCE
AUTHORS	Jon R Aderhold, G Gordon and George W Scott Jul 1976 28 p ref (Contract NAS2-8935)	PUBLICATION DATE
CONTRACT OR GRANT	(NASA-CR-137895, LMSC-D057322) Avail NTIS HC A03/MF A01 CSCI 01C	AVAILABILITY SOURCE
REPORT NUMBERS	The economic technical and environmental implications of remotely piloted vehicles (RPV) are examined. The time frame is 1980-85. Representative uses are selected, detailed functional and performance requirements are derived for RPV systems, and conceptual system designs are devised. Total system cost comparisons are made with non-RPV alternatives. The potential market demand for RPV systems is estimated. Environmental and safety requirements are examined, and legal and regulatory concerns are identified. A potential demand for 2,000-11,000 RPV systems is estimated. Typical cost savings of 25 to 35% compared to non-RPV alternatives are determined. There appear to be no environmental problems, and the safety issue appears manageable. Author	COSATI CODE

TYPICAL CITATION AND ABSTRACT FROM IAA

NASA SPONSORED		AVAILABLE ON MICROFICHE
AIAA ACCESSION NUMBER	A77-10214 #	
TITLE	Resizing procedure for structures under combined mechanical and thermal loading H M Adelman (NASA, Langley Research Center, Hampton, Va) and R Narayanaswami (Old Dominion University, Norfolk, Va) AIAA Journal, vol 14, Oct 1976, p 1484-1486 6 refs	AUTHORS
PUBLICATION DATE	The fully-stressed design (FSD) appears to be the most widely used approach for sizing of flight structures under strength and minimum-gage constraints. Almost all of the experience with FSD has been with structures primarily under mechanical loading as opposed to thermal loading. In this method the structural sizes are iterated with the step size, depending on the ratio of the total stress to the allowable stress. In this paper, the thermal fully-stressed design (TFSD) procedure developed for problems involving substantial thermal stress is extended to biaxial stress members using a Von Mises failure criterion. The TFSD resizing procedure for uniaxial stress is restated and the new procedure for biaxial stress members is developed. Results are presented for an application of the two procedures to size a simplified wing structure. S D	AUTHOR'S AFFILIATION

AERONAUTICAL ENGINEERING

A Special Bibliography (Suppl. 83)

MAY 1977

IAA ENTRIES

A77-19329 # Optimal control of thrust and angle of attack of an aircraft performing a climb-acceleration maneuver (Optimal'-noe upravlenie tsiagoi i ugloim ataki letatel'nogo apparata pri maneuvre pod'em-razgon) V F Krotov and M M Khrustalev In *Problems of analytical mechanics and stability and control theories*

Moscow, Izdatel'stvo Nauka, 1975, p 168 175 7 refs

In Russian

The problem of optimal control of thrust and angle of attack is solved for an aircraft moving in a central gravitational field under the action of aerodynamic drag and engine thrust. Allowance is made for variable mass, and the problem can be considered for a fixed range

P T H

A77-19464 # Aircraft environmental control problems as a result of air contamination P F Halfpenny (Lockheed California Co., Burbank, Calif.) *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Diego, Calif., July 12-15, 1976, Paper 76-ENAS-13* 9 p 9 refs Members, \$1 50, nonmembers, \$3 00

Particulates that occur naturally in the atmosphere in the form of dust and dirt as well as those particulates and vapors that are a result of industrial processes affect adversely aircraft environmental systems. The sources of contaminants are considered along with some of the effects and the design features which can be employed to minimize the adverse effects. Atmospheric dust ingested by the engines, APU's, and high pressure ground carts is the primary aircraft system source of contamination. It is pointed out that the development of bleed ports which are effective in removing atmospheric contaminants is the long range optimum solution. Until then, components must be designed and installed to make them more tolerant to dirt

G R

A77-19471 # Fluidic applications to aircraft environmental control systems J E McNamara and J Eyth, Jr (U S Naval Material Command, Naval Air Development Center, Warminster, Pa.) *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Diego, Calif., July 12-15, 1976, Paper 76-ENAS-21* 14 p Members, \$1 50, nonmembers, \$3 00

The environmental control system (ECS) of an aircraft is approached as a logical candidate for implementation of fluidic control technology without electrical interfaces, since the ECS utilizes air for various onboard functions (life support, cooling of electronic equipment, pressurization, defogging, and anti-g suits). A typical ECS is described, along with an account of a design approach to a fluidic ECS, and a discussion of ECS components. Two variant approaches to ECS arrangements and ECS performance tests are examined in parallel. The two fluidic ECS are compared and both are found to be satisfactory implementations

R D V

A77-19492 # Cooling methods for aircraft electronics equipment J K Goldstein (Lockheed California Co., Burbank, Calif.) *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Diego, Calif., July 12-15, 1976, Paper 76-ENAS-51* 8 p Members, \$1 50, nonmembers, \$3 00

Cooling of aircraft instruments, avionics, and other electronics will result in improved component reliability. This paper explores several techniques of controlling the thermal environment of the equipment, including use of the existing aircraft air conditioning system, external conditioned air, and the addition of a separate avionics cooling package. Each system is evaluated regarding cooling ability, cooling availability, and cost, providing a suitable criteria for a decision regarding cooling benefits and system selection. (Author)

A77-19502 # The Mini Boat - A life boat for helicopter crewmen G P Gillespie (U S Naval Material Command, Naval Air Development Center, Warminster, Pa.) *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Diego, Calif., July 12-15, 1976, Paper 76-ENAS-61* 6 p 5 refs Members, \$1 50, nonmembers, \$3 00 Navy-supported research

By taking advantage of advancements in the state-of-the-art of fabrics, the Naval Air Development Center has designed Mini Boats with center of mass below the center of buoyancy, as an alternative to current one man life raft (LR-1) for the potential helicopter crash survivors. The Mini Boat concept has evolved through four stages by the trial-and-error process. All four stages make use of CO2 inflation-cells to partially inflate the boat, with complete inflation done orally. The bail of the water is done by the crew men's helmets. Thermal protection is also provided. The fourth and the final form of Mini Boat is 50% lighter (3 lb), 66% less bulky and has a better stability and comfort than the LR-1. Compactification of the Mini Boat into 7 x 5 x 3 in. package and future application of it to all Helos and Cargo/Transport Aircraft are also predicted. A Y

A77-19649 # Energy considerations in aeronautical transportation /The W Rupert Turnbull Lecture/ E P Cockshutt (National Research Council, Ottawa, Canada) *(Canadian Aeronautics and Space Institute, Annual General Meeting, Toronto, Canada, May 10 12, 1976)* *Canadian Aeronautics and Space Journal*, vol 22, Nov-Dec 1976, p 284-297 13 refs

Data are reviewed which indicate that passenger transport by air involves energy expenditures comparable to automotive and rail modes. It is demonstrated that stage length and load factor are the critical parameters in establishing energy costs, and that long-haul travel is well accommodated by current wide body transports. It is suggested that the adoption of urban-oriented automobiles for city use, with the expanded use of aircraft for inter-city travel, could result in significant energy savings. Along with such a development would be the evolution of energy-efficient short haul aircraft, based essentially on current technology. (Author)

A77-19650 # An avionics design philosophy for a Canadian coastal patrol aircraft M Walker (Canadian Forces Air Navigation School, Winnipeg, Canada) *Canadian Aeronautics and Space Journal*, vol 22, Nov-Dec 1976, p 298-313 29 refs

To meet primary requirements, the coastal patrol avionics

should be optimized to perform detection, localization, and positive identification of maritime surface contacts, the gathering of surface contact intelligence, coercion (if necessary) against surface violators, and search and rescue. With this in view, the intent of the present paper is to examine how an avionics suit can best be optimized to the coastal patrol role. The major items covered are: system design, the navigation subsystem, communications, sensors, radar, electronic support measures, ancillary systems, computer selection, airframe modifications, and flare chutes. It is seen that the systems described will enable any light/medium transport to become a remarkably effective coastal patrol aircraft at a very reasonable cost. V P

A77-19708 Flow in turbomachines with nonuniform inlet velocity distribution. B G Duf'skii and A G Kukinov (*TsAGI, Uchenye Zapiski*, vol 5, no 3, 1974, p 18-27) *Fluid Mechanics - Soviet Research*, vol 5, Jan-Feb 1976, p 51-62. Translation.

The paper examines the flow characteristics of a turbomachine consisting of several blade cascades between flat walls, with an inlet channel velocity distribution which is nonuniform along the span of the blades and along the cascade front. A perturbation of the velocity component normal to the cascade front at an infinite distance from the first cascade is studied as is the relation of velocity perturbations in front of and in back of the cascade and the relation of perturbations at the ends of the interblade channel. B J

A77-19710 Efficiency of tangential boundary layer blowing in conical diffusers. M O Frankfurt (*TsAGI, Uchenye Zapiski*, vol 4, no 5, 1973, p 50-55) *Fluid Mechanics - Soviet Research*, vol 5, Jan-Feb 1976, p 140-145. Translation.

The effect of tangential boundary layer blowing on the flow structure and efficiency of a diffuser channel was investigated for diffusers with aperture angles of 10, 30, and 60 degrees and expansion ratios in the range from 3 to 8. Blowing was accomplished by ring slots situated at the diffuser inlet and various locations along its length. Velocity profiles and pressure losses were measured. Pressure losses were minimized with blowing at the inlet only. P T H

A77-19732 # Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow (Avtomodel'noe predstavlenie struktury gazodinamicheskoi oblasti pri istechenii sil'no nedorasshirennoi strui gaza v sputnyi giperzvukovoi potok). G A Khramov and S F Chekmarev *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 94-99. 6 refs. In Russian.

A77-19733 # Effect of a conical break in delta wings on aerodynamic characteristics (Vlianie konicheskogo izloma treugol'nykh kryl'ev na aerodinamicheskie kharakteristiki). A L Gonor, V V Kravets, and A I Shvets *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 100-104. 11 refs. In Russian.

The paper reports the results of experimental investigations of the aerodynamical coefficients and pressure on the windward side of delta wings with a conical break. A comparison was also made between the aerodynamic quality parameters of delta wings with conical break and of wing-cone models with caret shaped symmetric arrangement at a Mach number of 5.96. P T H

A77-19739 # Experimental investigation of the characteristics of small-dimensioned nozzles (Eksperimental'noe issledovanie kharakteristik malorazmernykh sopel). V A Butenko, Iu P Rylov, and V P Chikov *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 137-140. 7 refs. In Russian.

The momentum and discharge coefficients were determined experimentally for nozzles with boundary layer displacement thickness less than or equal to 1 mm in the range of Reynolds numbers from 200 to 7,000. The high degree of accuracy of the formula of Kuluva and Hosack (1971) for determining the discharge coefficient has been confirmed. A formula is proposed for determining the momentum coefficient as a result of approximating the experimental data in the Reynolds number range studied. P T H

A77-19742 # Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows (Issledovanie vlianiia formy sopla na kharakteristiki prostranstvennykh do- i sverkhzvukovykh techenii). V M Dvoret'skii *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 147-151. 10 refs. In Russian.

The characteristics of three dimensional subsonic and supersonic flows of an inviscid and nonheat-conducting gas in nozzles of complex shape were analyzed. The investigation was based on numerical integration of a system of gas dynamics equations with the aid of monotonic finite difference schemes of first order accuracy. Flow in the whole nozzle channel, including subsonic and supersonic regions, was computed, and the results show how a suitable choice of nozzle profile shape can affect the distribution of the nonuniformity characteristics of the flow. P T H

A77-19743 # Investigation of strongly underexpanded submerged jets (K issledovaniu sil'no nedorasshirenykh zatoplennykh strui). M Ia Ivanov and V I Kireev *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 151-154. 7 refs. In Russian.

The paper reports the results of a numerical study of the propagation of strongly underexpanded jets of an ideal gas in a submerged space at nozzle outlet Mach numbers slightly above unity. At the same time, the angle of turn of the flow near the edge of the conical nozzle may exceed 90 deg, and the boundary of the jet goes beyond the outlet section. It is shown that a self similarity parameter for the geometric dimensions of the computed flows is the square root of the pressure ratio. The dependence of the longitudinal dimensions of such jets on Mach number at the nozzle outlet is close to linear. The effect of the ratio of the specific heats on the shape of the jet boundary and the trailing shock wave is illustrated. P T H

A77-19744 # Investigation of supersonic flow past elongated blunt bodies of elliptical cross section (Issledovanie sverkhzvukovogo obtekaniiia udlinennykh zatoplennykh tel s ellipticheskoi formoi poperechnogo secheniia). A V Antonets and Iu M Lipnitskii *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 155-159. 12 refs. In Russian.

The paper presents the results of some numerical calculations of the characteristics of the three dimensional flow of an ideal gas past blunt bodies whose cross sections are ellipses with constant or variable axis ratio along the length of the body. Flow characteristics past an elliptic cone are compared with asymptotic characteristics for conical flows. As one proceeds downstream, the pressure distribution over the meridional angle on the blunt elliptic cone approaches that of the asymptotic conic solution, but because of the entropy effect the values of the density and temperature differ by a factor of 3. Pressure distributions are compared which were obtained by exact calculations and by the method of local blunt cones. Computed and experimentally determined aerodynamic coefficients are also compared. P T H

A77-19746 # Investigation of the size of the wake of a cone flying at hypersonic speed (Issledovanie razmerov sleda za konusom, letishchim s giperzvukovoi skorost'iu) S Iu Cherniavskii *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 161-163 8 refs In Russian

Experiments were conducted in a hermetic ballistic chamber in which a light gas gun was used to hurl a blunt cone through the air at Mach 12. The half aperture angle of the cone was 10 degrees, the base diameter was 9 mm, the radius of the blunt part was 0.06 of the base diameter, the Reynolds number was 0.3×10^6 to the 6th, the angle of attack range was 12-24 degrees. Shadow photographs were taken to determine the mean width of the hypersonic wake and the mean-square deviation of its boundary. B J

A77-19747 # Calculation of base pressure in ejector nozzles of different length for the case of a zero ejection coefficient (Raschet donnogo davleniia v ezhektornykh soplakh razlichnoi dliny pri nulevom koeffitsiente ezhekttsii) N L Efremov and R K Tagirov *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Nov-Dec 1976, p 164-166 In Russian

A77-19764 * # A numerical method for the exact calculation of airloads associated with impulsively started wings J M Summa (Analytical Methods, Inc., Bellevue, Wash.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-2* 12 p 23 refs Grant No. NSG 2101

A numerical method is developed to calculate three-dimensional potential flows due to the steady and impulsive motion of isolated wing and wing-wing interaction problems. The velocity potential is represented by a discrete set of constant-doublet quadrilaterals on wing and wake surfaces. The exact surface boundary condition is enforced, and the solution is obtained in a step-by-step fashion, configurations being impulsively started from rest. Free-wake geometries are generated for each time step with Rankine or Lamb viscous vortex segments used in wake-velocity calculations. Sample results include calculated performance to steady state for a thick wing and indicial lift of a wing-wing interaction problem. (Author)

A77-19765 # Three-dimensional turbulent boundary layer calculations for swept wings J D McLean (Boeing Commercial Airplane Co., Seattle, Wash.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-3* 15 p 12 refs

A computer program for the prediction of three-dimensional boundary layers has been developed for use in analyzing boundary layers on finite swept wings. The program uses an implicit finite-difference method to solve the three-dimensional compressible boundary-layer equations for either laminar or turbulent flow. In the turbulent case, a simple effective viscosity model is used for the turbulent shear stresses. The accuracy of the numerical method and applicability of the turbulence model are demonstrated in comparisons with experimental test cases. Computed results are presented for typical transport-type swept wings. (Author)

A77-19766 # Viscous perturbation effects on hypersonic unsteady aerodynamics L E Ericsson (Lockheed Missiles and Space Co., Inc., Sunnyvale, Calif.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-5* 13 p 31 refs Contract No. N62269-73-C-0713

In the present study a simplified approach, tailored to the particular flow conditions of interest for a tactical missile operating

in the low hypersonic flow regime, has been used to determine the dynamic effects of hypersonic viscous-inviscid interaction. It is shown that the experimentally observed changes of the inviscid unsteady aerodynamics of finite thickness airfoils due to viscous effects can be computed in a direct, simple manner using an embedded flow concept. Not only is the agreement good between present predictions and experimental static and dynamic data, the present perturbation method also gives results that are in close agreement with those obtained by use of Orlik Ruckemann's more exact theory. (Author)

A77-19772 # Flow measurements in leading edge vortices P M Sforza, W Stasi, J Pazenza, and M Smorto (New York, Polytechnic Institute, Farmingdale, N.Y.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-11* 12 p 10 refs ERDA-NSF-supported research

An experimental study of the vortex flow field over slender delta planforms with sharp leading edges is presented. Complete velocity measurements in this three-dimensional flow field are obtained by means of a Conrad-type probe used in conjunction with a five-degree-of-freedom traversing mechanism; flow visualization is achieved by an oil fog technique. Effects of angle of attack, camber, sweepback, and other parameters are described. An application of such flows, wind energy conversion by means of the vortex augmentor concept, is discussed. (Author)

A77-19778 * # Influence of fuel temperature on supersonic mixing and combustion of hydrogen R C Rogers (NASA, Langley Research Center, Hampton, Va.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-17* 11 p 12 refs

Results are presented from an experimental investigation of the influence of fuel stagnation temperature on the mixing and reaction of hydrogen injected transverse to a supersonic flow in a duct. The hydrogen fuel was injected stoichiometrically at stagnation temperatures of 300 K and 800 K from a row of five circular orifices in the duct wall. Detailed measurements in the flow at the duct exit are used to determine the overall amount of mixing accomplished at each of three test conditions. Static pressure distributions are used with duct wall temperatures and heat flux in a one-dimensional analysis to deduce the fraction of fuel reacted along the duct. Results from the one-dimensional analyses of the tests with hot fuel indicated slightly more fuel reacted at the exit, however, differences in the accomplished mixing obtained from integrations of exit surveys were small. A77-19787 * # Estimation of weapon-radius versus maneuverability trade-off for air-to-air combat H J Kelley and L Lefton (Analytical Mechanics Associates, Inc., Jericho, N.Y.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-35* 9 p 9 refs Contract No. NAS2 8738

A chase in a horizontal plane between a pursuer with a large capture radius and a more maneuverable evading vehicle is examined with constant speed vehicle models. An approximation to the 'sidestepping' maneuver of the Homicidal Chauffeur Game is modified to account for the effect of evader turning rate, and an estimate of capture radius required is so obtained which agrees remarkably well with Cockayne's point-capture result. The maneuver assumes central importance for barrier surfaces appearing in the Game of Two Cars. Results are given for required weapon capture-radius in terms of the maneuverability of the two vehicles. Some calculations of capture radius are presented. (Author)

A77-19796 # Combustion modelling within gas turbine engines, some applications and limitations J Odgers (Universite Laval, Quebec, Canada) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-52* 11 p 50 refs

A review is given of some of the more pertinent models postulated to describe the performance of gas turbine combustors. Six different design/development stages are considered: (1) the initial sizing of a combustor, (2) the initial development testing, (3) primary zone modelling, (4) secondary zone modelling, (5) dilution zone modelling, (6) changes due to the alteration of ambient conditions. The models are assessed in scope, plausibility, experimentally, and in terms of time and economic justification. For (1) it is suggested that a zero dimensional model will suffice, as also for (2). Item (3) will probably require a three-dimensional model, (4) and (5) will probably suffice with a one or two dimensional model. For item (6) a zero order model might well be satisfactory. If it can be produced with sufficient accuracy, a single complex (probably three-dimensional) model could adequately describe all items, (1) to (6). A short discussion deals with the need of future data, and the paper recommends the type of models which may be used currently, and those which are likely to be used in the future. (Author)

A77-19799 * # Airframe noise measurements by acoustic imaging J M Kendall (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-55* 10 p 17 refs. Contract No. NAS7-100

Studies of the noise produced by flow past wind tunnel models are presented. The central objective of these is to find the specific locations within a flow which are noisy, and to identify the fluid dynamic processes responsible, with the expectation that noise reduction principles will be discovered. The models tested are mostly simple shapes which result in types of flow that are similar to those occurring on, for example, aircraft landing gear and wheel cavities. A model landing gear and a flap were also tested. Turbulence has been intentionally induced as appropriate in order to simulate full-scale effects more closely. The principal technique involves use of a highly directional microphone system which is scanned about the flow field to be analyzed. The data so acquired are presented as a pictorial image of the noise source distribution. An important finding is that the noise production is highly variable within a flow field and that sources can be attributed to various fluid dynamic features of the flow. Flow separation was not noisy, but separation closure usually was. (Author)

A77-19800 * # An experimental investigation of airframe component interference noise P J W Block (NASA, Langley Research Center, Hampton, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-56* 10 p 12 refs

Measurements of noise produced by a model of a wheel well (rectangular cavity), landing gear (wheel and strut), and flap at Mach numbers of 0.18 and 0.40 have been made in an anechoic flow facility. Individual component noise and component interference noise are described in terms of the OASPL, spectra, and streamwise or flyover directivity patterns. Areas of significant sound generation are illuminated and causes of these noise sources are suggested. Results from an acoustic imaging technique are used to point out other source regions not discernible by simple far-field measurements. (Author)

A77-19801 * # Airframe noise of component interactions on a large transport model J G Shearin and D J Fratello (NASA, Langley Research Center, Hampton, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th,*

Los Angeles, Calif, Jan 24-26, 1977, Paper 77-57 9 p 6 refs

Airframe noise produced by aircraft components and their interactions on a model of a wide body transport was investigated in an open jet anechoic flow facility. The two meter span model had leading edge and multigapped trailing edge flaps, undercarriage, and associated stowage compartments. Each of these components were extended and retracted so their individual and interactive contributions to the measured airframe noise could be determined. An analysis of variance was performed which revealed a statistical significance of the component interactions. Various airframe noise reduction techniques were tried to reduce airframe noise. The effects of these techniques on the model's lift and drag were also measured. (Author)

A77-19813 # Stability derivative measurements with magnetically suspended cone cylinder models D Bharathan (Virginia, University, Charlottesville, Va) and S S Fisher *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-79* 9 p 13 refs. Grant No. AF AFOSR 74-2705

In an initial feasibility study, stability derivatives for 5 and 7 caliber cone cylinder models have been measured at $M = 0.071$ and $Re = 13,000$ by suspending each model electromagnetically in a small subsonic wind tunnel, forcing it in periodic, combined pitching/heaving motion at frequencies near pitch resonance, and comparing its frequency response with flow to that without flow. Drag coefficients are measured as well. The apparatus and techniques employed are described, the analytical model used to extract the derivatives from the response data is outlined, typical response data are shown, comparisons are made with conventionally obtained, similar data from other facilities, and a general assessment of the technique is made. (Author)

A77-19815 * # Scramjet exhaust simulation technique for hypersonic aircraft nozzle design and aerodynamic tests J L Hunt, N A Talcott, Jr, and J M Cabbage (NASA, Langley Research Center, High-Speed Aerodynamics Div, Hampton, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-82* 10 p 20 refs

Current design philosophy for scramjet powered hypersonic aircraft results in configurations with the entire lower fuselage surface utilized as part of the propulsion system. The lower aft end of the vehicle acts as a high expansion ratio nozzle. Not only must the external nozzle be designed to extract the maximum possible thrust force from the high energy flow at the combustor exit, but the forces produced by the nozzle must be aligned such that they do not unduly affect aerodynamic balance. The strong coupling between the propulsion system and aerodynamics of the aircraft makes imperative at least a partial simulation of the inlet, exhaust, and external flows of the hydrogen burning scramjet in conventional facilities for both nozzle formulation and aerodynamic force data acquisition. Aerodynamic testing methods offer no contemporary approach for such vehicle design requirements. NASA-Langley has pursued an extensive scramjet/airframe integration R&D program for several years and has recently developed a promising technique for simulation of the scramjet exhaust flow for hypersonic aircraft. Current results of the research program to develop a scramjet flow simulation technique through the use of substitute gas blends are described in this paper. (Author)

A77-19819 # Fluctuating pressure environment of a drag reduction spike R A Guenther and J P Reding (Lockheed Missiles and Space Co, Inc, Sunnyvale, Calif) *American Institute of*

Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-90 11 p 8 refs

Wind-tunnel measurements have been made of the fluctuating pressure environment in a region of spike induced flow separation. Extremely large pressure fluctuations (36% of free-stream dynamic pressure) were measured on the sides of the spike base at transonic speeds which are related to the nonaxisymmetric vortical nature of the separated flow at angles of attack greater than zero. Even higher pressure fluctuations were observed on the windward side of the nose cap at supersonic speeds and angles of attack of at least 7 deg. This is the result of an intermittent shock-shock interaction. The method of Coe et al. (1972) of normalizing the spectral data with the local separated flow height was moderately successful in collapsing the data into a manageable number of characteristic spectra. However, the spectra for the spike-induced separation at supersonic speeds agreed better with the results of Speaker and Ailman (1966) for two dimensional step-induced separation than they did with the three-dimensional ramp-induced separation of Coe et al. Spectral peaks were observed that corresponded to Roberts critical subsonic wake flapping frequency. (Author)

A77-19820 # Hypersonic flow over indented nosetips B L Reeves, A Todisco, T C Lin, and A Pallone (Avco Corp., Avco Systems Div., Wilmington, Mass.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-91 15 p 10 refs* Contract No F04701-74 C-0208

A comprehensive series of experiments to obtain fundamental environmental data on passive nosetip shapes which can occur during reentry has been conducted. Pressure and heating measurements were obtained for five models covering a sequence of indented nosetip shapes observed from recession data. The models consisted of four steady flow indented shapes and one pulsating flow model. A significant result of these tests is the important role played by entropy layer swallowing in determining heating levels on indented shapes. Flow separation at hypersonic speeds increases the rate of swallowing and can result in as much as a 70% increase in local heating. (Author)

A77-19821 # Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows R J Swigart (Aerospace Corp., El Segundo, Calif.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-92 12 p 22 refs*

A theoretical investigation of the effects of free-stream vorticity on skin friction and heat transfer in the vicinity of the stagnation point in both two dimensional and axisymmetric stagnation-point flows has been carried out, the solution for the axisymmetric case being presented for the first time. The vorticity is assumed added at the outer edge of the boundary layer, and its effect on boundary layer properties as it is convected through the boundary layer and stretched as it passes over the body is analyzed in detail. In both the two dimensional and axisymmetric cases the effect of the added vorticity is to increase both the skin friction and heat transfer, the effect being more pronounced in the axisymmetric case. (Author)

A77-19827 # Reynolds number and nozzle afterbody configuration effects on model forebody and afterbody drag A V Spratley, E R Thompson, and T L Kennedy (ARO, Inc., Arnold Engineering Development Center, Arnold Air Force Station, Tenn.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-103 13 p 7 refs*

An experimental investigation was conducted to study the Reynolds number and nozzle afterbody/boattail configuration ef-

fects on forebody and afterbody drag. The model used was a sting mounted axisymmetric body with an area distribution typical of a high performance fighter aircraft. Three boattail geometries were investigated at Mach numbers from 0.60 to 1.40 and over a characteristic Reynolds number range from 16×10^6 to the 6th to 57×10^6 based on model length. Generally, forebody drag was found to be independent of afterbody geometry. Reynolds number had only a minimal effect on forebody and afterbody drag. (Author)

A77-19830 # An evaluation of jet simulation parameters for nozzle/afterbody testing at transonic Mach numbers W L Peters and T L Kennedy (ARO, Inc., Arnold Air Force Station, Tenn.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-106 12 p*

The objective of this investigation was to evaluate various jet simulation parameters to establish a method of simulating the turbojet exhaust effects on aircraft aerodynamics. Successful parameters were determined based on their ability to correlate afterbody pressure drag for jet flows with either jet total temperature, nozzle exit to throat area ratio, or nozzle divergence half angle as a variable. Data were utilized from an isolated nozzle/afterbody model tested at free stream Mach numbers from 0.6 to 1.5. Jet simulation parameters were evaluated at jet total temperatures from 540 to 3300 R for a sonic nozzle. Nozzle exit-to-throat area ratios from 1.000 to 1.475 and nozzle divergence half angles from 0 to 10 deg were evaluated with a cold high pressure air jet flow. (Author)

A77-19836 # Aeromechanics of mission completion for structurally damaged aircraft R R Snodgrass and R A Bates (USAF, Aeronautical Systems Div., Wright Patterson AFB, Ohio) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-112 11 p*

An aeromechanical analysis method is developed to assess the mission completion capabilities of an aircraft after exposure to varying levels of blast, thermal, or fragmentation environments is established. The major aerodynamic problem for the structures disciplines must first define the extent and modes of structural damage such that the added drag can be determined. The aerodynamic procedure structurally surveys the aircraft for material, material gages and construction which relates to damage from an appropriate varying threat, allowing the damage and drag to increase until the system can just complete the assigned mission. The results suggest a handbook method for the crew to assess the damage for degraded mission capabilities. (Author)

A77-19837 # A rational new approach to the response of an aircraft encountering non-Gaussian atmospheric turbulence J C T Wang and S F Shen (Cornell University, Ithaca, N Y.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-115 12 p 17 refs* Grant No AF AFOSR 74 2659

Based on the techniques of expanding a random function in terms of statistically orthogonal random functionals, a method is developed for analyzing the response of an aircraft to a stationary weakly non-Gaussian atmospheric turbulence. The atmospheric turbulence is characterized through the correlation functions, and no other ad hoc assumptions are necessary. The expansion kernels enable us to construct various probability density functions of interest e.g., the joint probability density function of the response velocity and acceleration. To illustrate the method and demonstrate some of the effects due to the non Gaussian nature of atmospheric turbulence, the simple case of the plunging motion of a rigid aircraft in a turbulent gust is presented in detail. (Author)

A77 19855 # A general theory of turbulent combustion - The Lagrangian aspects D B Spalding (Imperial College of Science and Technology, London, England) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-141* 10 p 44 refs

In the development of combustion theory the classical approach of chemical kinetics had been abandoned in favor of a new approach, called the Eulerian approach. The classical approach, called the Lagrangian approach, had followed the temporal variations of the concentration and temperature of distinct parcels of matter. In the Eulerian approach attention is focussed on space rather than on matter and the convective and diffusive transport of matter through this space is considered. A current crisis in the theoretical study of combustion is related to difficulties regarding an application of the Eulerian approach in the case of turbulent reacting flows, in which the dependent variables are the time average concentrations of species and correlations. A description is given of a turbulent combustion theory which attempts to overcome the difficulties by means of an approach which combines Eulerian and Lagrangian methods. G R

A77-19857 # Computation of low speed flow about an asymmetric nacelle at incidence P Bansod (British Aircraft Corp., Ltd, Weybridge, Surrey, England) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-143* 11 p 15 refs

The low speed flow about an asymmetric nacelle was computed using the Cubic Spline Mode Source Singularity Method. Theoretical results are compared with experimental data for a range of incidences at three fan face velocity ratios which corresponded to the through-flow flow condition, engine wind milling case and engine mass flow at take off. Off-body flow direction plots were made in the plane of symmetry. Boundary layer computations were presented for the forebody, inlet and diffuser. (Author)

A77-19860 * # Transonic performance of an auxiliary airflow system for axisymmetric inlets N E Sorensen and E A Latham (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-148* 6 p 5 refs

A large-scale model of an axisymmetric inlet with a centerbody auxiliary airflow system has been tested in the wind tunnel at transonic speeds. The auxiliary system allows additional airflow (other than in the main duct formed by the cowl and translating centerbody) to pass through the centerbody of the inlet and combine with the main duct airflow on its way to the engine face. The results of the tests are presented, and the inlet performance is compared to a closely related alternative inlet with a 'traveling' boundary-layer bleed system which precludes the use of a centerbody auxiliary airflow system. The comparison shows that the auxiliary airflow inlet can supply 7.7% more engine face airflow at Mach number 1.0 and is 26% shorter than the traveling bleed inlet. Even though maximum transonic airflow was not achieved at a comparable engine face mass-flow ratio of 0.580, a total-pressure distortion of 0.10 and a total-pressure recovery of 0.985 were achieved for the auxiliary airflow inlet while a recovery of only 0.965 was achieved for the traveling bleed inlet. (Author)

A77-19864 * # Effects of inviscid parallel shear flows on steady and unsteady aerodynamics and flutter M H Williams, M R Chi, E H Dowell (Princeton University, Princeton, N.J.), and C S Ventres (Bolt Beranek and Newman, Inc., Boston, Mass) *American Institute of Aeronautics and Astronautics, Aerospace Sciences*

Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-158 10 p 14 refs Grant No NGR-31-001-197

A general theory of planar disturbances in inviscid parallel shear flows, analogous to thin wing theory in potential flows, has been developed. Integral relations between surface pressure and deformation are obtained which are similar to, and can be solved by the same numerical methods as, those of potential flow. Computed results are shown which illustrate the effects of a model turbulent boundary layer on various lifting and nonlifting surfaces, including an elastic panel in low supersonic flow and an airfoil control surface in subsonic flow. (Author)

A77-19865 # Analysis of unsteady airloads of helicopter rotors in hover B M Rao (Texas A & M University, College Station, Tex) and P R Schatzle (Sandia Laboratories, Albuquerque, N Mex) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-159* 12 p 19 refs Grants No DAHC04-74-G-0184, No DAAG29-76-G-0241

A numerical lifting-surface method based on the velocity potential formulation has been developed for predicting the unsteady airloads on a hovering rotor in compressible flow using a realistic representation of the wake. Landgrebe's (1971) experimental/analytical model. The steady state loads compare well with available experimental results for four-bladed rotors, while the spanwise variation of the unsteady aerodynamic derivatives obtained shows a characteristic peak in the outboard region of the blade due to the tip vortex. (Author)

A77-19874 # Advanced techniques for computation of supersonic flow V V Rusanov (Akademiia Nauk SSSR, Institut Prikladnoi Matematiki, Moscow, USSR) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-173* 12 p 31 refs

A short review of the methods used for the computation of supersonic flows is given, and their development is discussed. Some means for the improvement of the BVLR (Babenko, Voskresenski, Lyubimov, Rusanov, 1964) algorithm are described which extend its sphere of application. The problem of boundary conditions in high-order difference schemes is studied at length for an arbitrary nonlinear hyperbolic system written in conserved form. A general method for constructing the boundary conditions in difference schemes is proposed. The examples given in the paper show that for the accuracy given, the use of the third-order difference scheme requires much less computer time than the use of the first- and second-order schemes. (Author)

A77-19875 # An inviscid model for submerged transonic wall jets N D Malmuth and W D Murphy (Rockwell International Science Center, Thousand Oaks, Calif) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-174* 13 p 14 refs Contract No N00014-76-C-0350

Nonlinear flow phenomena in transonic wall jets prototypical of propulsive lift devices such as lifting ejector augmenters and upper-surface blown wings have been studied using the Karman-Guderley (1962) model. From modern line relaxation methods, an efficient computational method has been developed to treat the diversity of shock patterns produced by various wall shapes and exit conditions. Associated with the algorithm is a far field determined analytically from the boundary value problem appropriate to subsonic conditions far downstream. Numerical results for circular arc boattails indicate rapid relaxation of the wall-induced disturbances, even in the supersonic region. Partially subsonic and supersonic jet

exit conditions lead to the anticipated wave interactions. Studies of other shapes show that branch point singular behavior associated with satisfaction of a Kutta condition at the wall trailing edge is obtained by demanding continuity of the perturbation potential at this point (Author)

A77-19876 # Flow survey behind wings Z El-Ramly and W J Rainbird (Carleton University, Ottawa, Canada) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-175* 11 p 26 refs National Research Council of Canada Grant No A-7799

Flow field surveys have been performed behind three different wings - a main wing, a rectangular wing, and a swept wing - in a low speed return circuit wind tunnel, up to 13 wing span downstream. The results include the three mean velocity and vorticity components, complete definition of the viscous and vortical wake, and the detailed loading of one of the wings. It is found that the vortical wake is contained within the viscous region of the wake. The vortex is never fully roll-up within the measuring range of the experiment. It is found that the Betz model of roll-up suggested for the experiment overestimates the tangential velocity and circulation near the vortex center, because it does not consider viscous effects. The model, however, provides a good working tool since it gives reasonable predictions of the flow field over a range that would be of interest to a following aircraft B J

A77-19893 # Penetration and break-up of liquid fuel jets in high subsonic speed airstreams J A Schetz and A Padhye (Virginia Polytechnic Institute and State University, Blacksburg, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-201* 11 p 12 refs Grant No AF-AFOSR 74 2584

An experimental study of the penetration and break-up of liquid jets injected normal to high subsonic speed ($M = 0.45$ and 0.75) airstreams through injection ports of various geometries and sizes is reported. The measurement techniques were primarily optical, employing 003 sec photos to produce 'streak' pictures for penetration measurements and 15×10 to the -9th sec photos to show the details of the break up process and some droplet size measurements. The penetration data were successfully correlated using groupings of the variables and parameters suggested by a simple analysis (Author)

A77-19894 # Detailed measurements of the periodically unsteady flow produced by rotor and stator wake interaction in a multistage-turbomachine D P Schmidt and T H Okishi (Iowa State University of Science and Technology, Ames, Iowa) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-202* 13 p 18 refs Grant No AF AFOSR 76 2916

To aid in the understanding of rotor and stator viscous wake interaction, slow and fast response instrumentation have been employed to obtain time-average and instantaneous periodic average flow field measurements between the blade rows in a low speed multistage axial-flow compressor. Quantitative measurements indicate that the rotor blade wake pattern can vary significantly when influenced by an upstream stationary blade row and that relative circumferential positioning of the stationary blade rows can have considerable influence on downstream rotor and stator flow fields. Differences in aerodynamic and acoustic characteristics resulting from changes in unsteady wake interaction patterns were observed (Author)

A77 19896 # An experimental and numerical study of the 3-D mixing flows of a turbofan engine exhaust system S F Birch, G C Paynter (Boeing Aerospace Co., Seattle, Wash.), D B Spalding, and D G Tatchell (Concentration, Heat and Momentum, Ltd., London, England) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-204* 13 p 6 refs

An experimental and numerical study was conducted to investigate the use of 3-D viscous analysis for design of internal mixers for jet noise suppression. Three flows, a full scale free mixer, a full scale lobed mixer and a model scale lobed mixer, were selected for study. To insure a valid prediction, the analysis was applied to the selected flows without reference to or knowledge of the experimental results. Details of the experiments, turbulence modeling, and determination of initial flow properties from engine operating properties are described. The experimental and analytical results with a discussion as to the usefulness of the analysis for mixer design are presented (Author)

A77-19897 * # Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions W F Ballhaus (NASA, Ames Research Center, U S Army, Air Mobility Research and Development Laboratory, Moffett Field, Calif) and P M Goorjian (Informatics Corp., Palo Alto, Calif) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-205* 11 p 17 refs

A computer code, LTRAN2, has been constructed that efficiently computes low frequency unsteady transonic flows about airfoils in motion. The code solves the two dimensional, nonlinear, low-frequency, small-disturbance equation by an alternating-direction implicit (ADI) algorithm. First, as a check on the code, LTRAN2 is used to solve the linear, low frequency, small disturbance equation. The results are compared with known answers from linear theory. Then nonlinear results are presented. Tijdeman's experimental observations of shock wave motions resulting from airfoil flap oscillations are qualitatively reproduced by LTRAN2. These computations compare favorably with those of Magnus and Yoshihara and are obtained in substantially less computer time. Also the underlying theory of the governing equation and the construction of the algorithm are discussed (Author)

A77-19899 # Calculation of transonic wing flows by grid embedding C W Boppe (Grumman Aerospace Corp., Bethpage, N Y) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-207* 12 p 17 refs

This paper describes a new approach to the calculation of three dimensional inviscid transonic flows. The computational procedure, which employs a finite difference relaxation scheme, differs from existing methods in two ways: first, by choice of the flow governing equation and second, by a technique for embedding one computational grid structure within another. Fine mesh calculations are performed only in regions near the wing where gradients are large and details are important. This results in improved computational resolution and reduced computing time, as compared to current methodology. In addition, the approach does not require global geometry fitting coordinate transformations. These features provide flexibility for treating complex three dimensional geometries which, to date, have been impractical or impossible to compute. Sample calculations for airfoils, wings, and canard wing combinations are included (Author)

A77-19900 * // An approximate calculation of the strong interaction on a transonic airfoil A Segner and W C Rose (NASA, Ames Research Center, Moffett Field, Calif) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-210* 9 p 28 refs

This paper describes an interactive computational scheme that calculates the transonic flow field over an airfoil The inviscid flow, the turbulent boundary layer in the weak interaction region, and the elliptic flow in the strong interaction region are computed separately, and the solutions are matched iteratively in a direct, second order interaction scheme The pressure distribution, obtained from a transonic, small-perturbation solution, is prescribed on the boundary layer and the Navier Stokes equations and the ensuing displacement thicknesses are used to modify the inviscid flow The best overall results are obtained by using a turbulence model that eliminates the eddy viscosity in the strong interaction region Computed pressure distributions are compared with experimental data and with Navier Stokes solutions In weak interactions, the agreement with experimental data is very good, as it is also in strong interactions except for the pressures in the separated flow region There the agreement is qualitative only, and the pressure recovery is too high The results in both cases are superior or equal to those of the Navier Stokes solutions, and the present method is significantly faster (Author)

A77 19908 * // Analytical study of viscous effects on transonic flow over boattail nozzles R G Wilmoth (NASA, Langley Research Center, High Speed Aerodynamics Div, Hampton, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-223* 8 p 12 refs

An analytical study has been made of the effects of viscous/inviscid interactions on the transonic flow over boattail nozzles The theoretical method couples a relaxation solution of the full potential transonic flow equations with a conventional boundary-layer solution to account for displacement-thickness effects Surface pressures calculated on circular-arc boattails with solid jet plume simulators show good agreement with experiment for free stream Mach numbers less than 0.90 For separated flows, an empirical discriminating streamline model of the separation bubble gives good results until the onset of shock-induced separation, which occurs typically at a Mach number of about 0.90 (Author)

A77-19909 * // Numerical solution of axisymmetric boattail flow fields with plume simulators T L Holst (NASA, Langley Research Center, High-Speed Aerodynamics Div, Hampton, Va) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-224* 14 p 17 refs

Turbulent separating flows over axisymmetric afterbody-boattail configurations with solid sting plume simulators are computed with a time-dependent finite-difference method to solve the compressible Navier-Stokes equations The Reynolds stress terms are replaced with a two-layer eddy viscosity model including a relaxation formula to model the nonequilibrium effects of the separated flow The mesh is aligned with the boattail body through an analytic transformation which accommodates a wide variety of boattail geometries Numerical results for a series of boattail geometries over a wide range of Reynolds number (140,000 to 140 million) are presented and, when possible, compared with experimental data or independent numerical results (Author)

A77-19977 Prediction of the angular vibration of aircraft structures J Lee and P W Whaley (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio) *American Institute of*

Aeronautics and Astronautics and U S Air Force Wright Aeronautical Laboratory, Minisymposium on New Avenues for Progress in Aerospace Research Technology and Systems, Wright-Patterson AFB, Ohio, Mar 24, 1976) *Journal of Sound and Vibration*, vol 49, Dec 22, 1976, p 541 549 11 refs

With the Bernoulli-Euler beam used as a theoretical model, qualitative relationships have been developed to predict the angular vibration from a prescribed linear vibration response Based on laboratory and flight test data, the overall accuracy of predictions is within + or - 20% of the angular vibration measurement Such a prediction capability may be considered very significant in that the prediction schemes are intended only for qualitative purposes In addition, due to the difficulties in obtaining accurate angular measurements, the present vibration data are limited to a gross confirmation of predictions (Author)

A77-19981 * // Core noise measurements on a YF-102 turbofan engine M Reshotko, A Karchmer, P F Penko, and J G McArdle (NASA, Lewis Research Center, V/STOL and Noise Div, Cleveland, Ohio) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-21* 27 p 7 refs

Core noise from a YF 102 high bypass ratio turbofan engine was investigated through the use of simultaneous measurements of internal fluctuating pressures and far field noise Acoustic waveguide probes, located in the engine at the compressor exit, in the combustor, at the turbine exit, and in the core nozzle, were employed to measure internal fluctuating pressures Spectra showed that the internal signals were free of tones, except at high frequency where machinery noise was present Data obtained over a wide range of engine conditions suggest that below 60% of maximum fan speed the low frequency core noise contributes significantly to the far field noise (Author)

A77-19982 * // Flap noise and aerodynamic results for model QCSEE over-the-wing configurations W Olsen, R Burns, and D Groesbeck (NASA, Lewis Research Center, Cleveland, Ohio) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-23* 26 p 15 refs

Noise spectra in three dimensions and aerodynamic data were measured for a model of the NASA QCSEE (Quiet Clean Short-Haul Experimental Engine) over-the-wing configuration The effects of flap length, nozzle exhaust velocity, and nozzle geometry were determined using a single nozzle and wing-flap segment Related tests indicated that the scaled up model data would be representative of full scale flap noise with the QCSEE engine The scaled-up QCSEE model data imply that the noise goal will be very nearly attained (Author)

A77-19983 * // Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets D C Chou, R W Luidens, and N O Stockman (NASA, Lewis Research Center, Cleveland, Ohio) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif, Jan 24-26, 1977, Paper 77-144* 17 p 8 refs

The paper provides a theoretical description of the development of the boundary layer on the lip and diffuser surface of a subsonic

inlet at arbitrary operating conditions of mass flow rate, freestream velocity and incidence angle. Both laminar separation on the lip and turbulent separation in the diffuser are discussed. The agreement of the theoretical results with model experimental data illustrates the capability of the theory to predict separation. The effects of throat Mach number, inlet size, and surface roughness on boundary layer development and separation are illustrated. (Author)

A77-20006 # Electrical flight control for Boeing YC-14 M Scott (Marconi Elliott Avionics Systems, Ltd., Rochester, Kent, England) *Aircraft Engineering*, vol 49, Jan 1977, p 4-10

As part of the United States Air Force Advanced Medium STOL (AMST) program for modern tactical airlift in the 1980's, two prototype YC-14 aircraft are being manufactured by the Boeing Company with an advanced Electrical Flight Control System (EFCS) developed for them. After a description of YC-14 AMST, which can commute without refuelling between two 2000 ft semi-prepared runways 400 nm apart carrying 27,000 lbs and has USB (Upper Surface Blown) flap and lateral control 2.5 times more powerful than conventional aircraft, the technological background of YC-14 EFCS including the failure survival flight control system, is discussed. The operational details of the flight control electronics involve computer units, interface units, optical coupler units, optical data links, a control display panel and a test/failure identification panel. Further equipment details include the use of optical/electrical and electrical/optical interfacing circuits in optical data links, are presented. The flight software design which is structured into integrated modules each programmable to 10,000 words, is also discussed. A Y

A77-20025 Fifty years later The new Helicostat (Cinquante ans après - Le nouvel 'Helicostat') *Air et Cosmos*, vol 14, Jan 8, 1977, p 19-22, 40. In French

Revival of interest in the Helicostat, an arrangement using one or a pair of balloons for stabilization and one or several helicopter rotors for propulsion and guidance, is noted and old and new variants of Helicostat designs are described. Arrangements with a helirotor flanked by two stabilizing balloons, and capable of transporting girders or logs, and a single balloon flanked by two pairs of rotors and capable of lifting and transporting a 30-ton cargo container, are described. The enhanced stability of the craft (gentle descent even when fully loaded and with all engines failing) and cost estimates are emphasized. The latter ('catamaran') arrangement is recommended for load transfer operations in congested ports with inadequate facilities. R D V

A77-20080 * # An analytical method for ride quality of flexible airplanes R L Swaim, D K Schmidt (Purdue University, West Lafayette, Ind.), P A Roberts (USAF, Washington, D C), and A J Hinsdale *AIAA Journal*, vol 15, Jan 1977, p 47-9. 9 refs. Grant No. NSG 4003

A new and easily used method of aircraft ride quality analysis is developed, and its use is illustrated by a numerical example using DC-8 airplane equations of motion. The method readily allows any type of stability augmentation system to be included for good handling qualities. A particularly powerful method of specifying and achieving all roots of a desired closed-loop characteristic equation by use of full state variable feedback is described and applied to the DC-8 example. (Author)

A77-20085 * # Nonlinear steady incompressible lifting-surface analysis with wake roll-up E O Suciu and L Morino (Boston University, Boston, Mass.) *AIAA Journal*, vol 15, Jan 1977, p 54-58. 13 refs. Grant No. NGR-22-004-030

The problem of lifting surfaces in steady incompressible flow is considered in terms of an integral equation relating the potential discontinuity on wing and wake to the normal derivative of the potential (normal wash) on the lifting surface. The integral equation is approximated by a system of linear algebraic equations obtained by dividing the surfaces into small quadrilateral elements and by assuming the potential discontinuity and the normal wash to be constant within each element. The wake geometry is obtained through iteration by satisfying the condition that the velocity be tangent to the surface of the wake and that the potential discontinuity be constant along the streamlines. Numerical results are in good agreement with existing ones. (Author)

A77-20086 # The development of flow boundary layers in turbomachines (Zur Frage der Entwicklung von Strömungsgrenzschichten in Turbomaschinen) W Pache (Darmstadt, Technische Hochschule, Fachbereich Maschinenbau, Dr Ing Dissertation, 1976. 104 p. 70 refs. In German)

An experimental investigation was conducted of the formation of two-dimensional turbulent boundary layers on turbomachine components in unsteady (oscillating) flow conditions. Experiments were conducted in a low-speed wind tunnel with a turbulence generator at a Mach number of 0.1 and a Reynolds number of 4×10^5 to the 5th. Pneumatic pressure measurements and hot-wire anemometry were used to study the development of boundary layers on both flat plates and airfoil profiles. Experimental results were compared with those of a numerical method applied to the study of the formation of laminar boundary layers and to the formation of turbulent boundary layers in turbulent shear flow. B J

A77-20093 # On Newtonian flow past power-law bodies. R M Barron (Windsor, University, Windsor, Ontario, Canada) *AIAA Journal*, vol 15, Jan 1977, p 117-119. 6 refs.

Hui (1973) has developed an iterative method for studying the steady Newtonian flow past two-dimensional and axisymmetric bodies of any thickness at zero incidence. The leading terms of Hui's solution for power-law bodies are identical to those of Cole (1957). As Cole points out, these solutions have singularities such as zero density and infinite temperature at the airfoil surface, which arise because hypersonic small-disturbance theory does not account for the region of high entropy surrounding the body. Using the method of matched asymptotic expansions, Ryzhov and Terent'ev (1970) have studied the flow in the entropy layer enveloping bodies supporting power-law shocks. This paper obtains a uniformly valid solution under the Newtonian flow approximation by combining the outer solution of Cole and the inner solution of Ryzhov and Terent'ev. A two-dimensional symmetric airfoil of unit length chord placed in a uniform hypersonic stream of a perfect gas at zero incidence is considered. B J

A77-20095 # Incipient separation of leeward flow past a lifting plate in viscous hypersonic flow S L Gai (Indian Institute of Technology, Bombay, India) *AIAA Journal*, vol 15, Jan 1977, p 122-124. 9 refs.

It is known that when a thin flat plate of finite chord is set at incidence to an oncoming supersonic/hypersonic stream, the flow on the expansion side can separate resulting in a trailing edge stall. The stall depends on the angle of incidence, the Mach number, and the Reynolds number. This paper shows for the case of an adiabatic flat plate at incidence in viscous hypersonic flow that a simple correlation exists between the critical angle of incidence at which separation would first appear and the fundamental viscous hypersonic interaction parameter. B J

A77-20122 # Starting systems for aircraft gas turbine engines (Puskovye sistemy aviatsionnykh gazoturbinnnykh dvigatelei) B M Kats, E S Zharov, and V K Vinokurov. Moscow, Izdatel'stvo Mashinostroenie, 1976 220 p 73 refs In Russian

The present work is concerned with the theory and design characteristics of various starting systems for aircraft gas turbine engines (GTEs). Key factors governing selection of type and parameters of starting systems are identified. The influence of the starting characteristics of GTEs on the magnitude and behavior of the starting device power is assessed. Standards are derived for selecting the power of starting devices for various types of GTEs. Particular attention is directed to the analysis of design and characteristics for basic starting systems and their components, along with an evaluation of system effectiveness. Recommendations on selection of starting system type and parameters are made for flight vehicles of different types and applications. S D

A77 20123 # Applied gasdynamics /4th revised edition/ (Prikladnaia gazovaya dinamika /4th revised edition/) G N Abramovich. Moscow, Izdatel'stvo Nauka, 1976 888 p 61 refs In Russian

The gasdynamic principles of the theory of jet engines and similar systems are outlined, and the theory of one-dimensional gas streams, which forms the basis for modern approaches to the design of jet engines, rotating machines, ejectors, wind tunnels, and test stands is covered in detail. Special chapters are devoted to boundary layer theory and jet theory, and the use of these theories in the determination of the friction drag and velocity and temperature fields in nozzles, ejectors, combustion chambers, etc. Chapters dealing with hypersonic flows, rarefied gas flows, and with the elements of magnetohydrodynamics are included with a view toward space applications. V P

A77 20129 Symposium on Aeroelasticity in Turbomachines, Ecole Nationale Supérieure de Techniques Avancées, Paris, France, October 18-23, 1976, Proceedings (Symposium sur l'Aéroélasticité dans les Turbomachines, Ecole Nationale Supérieure de Techniques Avancées, Paris, France, October 18-23, 1976, Proceedings) Symposium sponsored by the International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz. *Revue Française de Mécanique*, Special Issue and Supplement, 1976 210 p In French and English

Papers are presented on the hydrodynamic interaction between profile cascades, on flutter instability in an annular cascade on the flutter characteristics of transonic compressor blades, and on the torsional stall flutter of an airfoil. Also considered are blade flutter in a subsonic turbine cascade, unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow, and a study of choking flutter. Rotor-stator interaction in a subsonic axial flow compressor stage, unsteady aerodynamic loading of rotor blades in a transonic axial flow compressor, and the use of thin-film transducers for measuring unsteady pressures in turbo machines are also examined.

B J

A77 20131 Preliminary reflections on the problems of aeroelasticity in turbomachines (Reflexions préliminaires sur les problèmes d'aéroélasticité dans les turbomachines) M Roy (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 7-9 In French

A general introduction is presented to the problem of flutter in turbomachines with emphasis on the fundamental difficulties associated with a theory of real flow in turbomachines and on the necessity, justified by practical experience, to use imperfect concepts of aeroelasticity in the analysis. Particular attention is given to the basic process of aeroelasticity - the interaction or coupling of the essentially elastic deformation of the structure in question and the flow around the structure. B J

A77-20137 Unsteady aerodynamic forces acting on loaded two-dimensional blades in nonuniform incompressible flows H Atassi (Notre Dame, University, Notre Dame, Ind.) and M E Goldstein (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 47-56 19 refs. Grant No AF AFOSR-74 2675

A complete systematic theory for inviscid incompressible flows about two-dimensional airfoils oscillating or subject to a periodic gust is developed which assumes that the fluctuating flow velocity is small compared with the mean flow velocity. The unsteady flow is linearized about the full potential flow of the airfoils, and effects of the mean-flow angle of attack and the airfoil geometry are completely accounted for through the mean potential flow. Some results are reported for application of the theory to the problems of a single airfoil in a periodic gust, an oscillating airfoil, a cascade of airfoils in a periodic gust, and a cascade of oscillating airfoils. It is shown that even small angles of incidence would produce separation near the leading edge of a very thin airfoil in a gust and would invalidate inviscid-flow analyses, that flow conditions are significantly altered mainly at the leading edge as an airfoil oscillates from one position to another, and that the unsteady aerodynamic force and moment acting on a cascade of oscillating airfoils can be split into two components - the wake induced component and the cascade response to the instantaneous upwash velocity. F G M

A77 20138 Some recent developments in unsteady aerodynamics of a supersonic cascade M Kurosaka and I H Edelfelt (General Electric Co., Schenectady, N.Y.) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 57-64 13 refs. Contract No F44620 74 C 0043

Recent developments in the study of the unsteady aerodynamics of supersonic cascades are reviewed, emphasizing hitherto unpublished analytical results on supersonic unstalled flutter. Characteristics and the physical mechanism of supersonic unstalled flutter are discussed, difficulties associated with the analysis of such flutter are examined, and the passage approach is outlined for circumventing the complication arising from the breakdown of acoustic theory in the far field in the case of low frequencies. The analysis is extended to the higher frequency range, and analytical results are presented for the low frequency case as well as for the cumulative nonlinear effect of airfoil shape. Results for isolated oscillating parabolic arc and flat plate airfoils are given which appear to explain the importance of airfoil shape in supersonic unstalled flutter. F G M

A77 20139 On the analysis of the aerodynamic and flutter characteristics of transonic compressor blades M F Platzer (U.S. Naval Postgraduate School, Monterey, Calif.), W R Chadwick, and P B Schlein (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris,*

France, Oct 18-23, 1976) *Revue Française de Mécanique*, Special Issue, 1976, p 65-72 20 refs Navy supported research

Studies of supersonic and transonic flows past oscillating cascades performed in the last four years are reviewed. The basic governing equations and necessary boundary conditions are given, a method-of-characteristics solution is developed for supersonic flow past oscillating flat-plate cascades, and a purely analytical solution is obtained for the case of a periodic flow. Approaches to supersonic and transonic flows which take thickness effects into account are evaluated. Results are presented for a study of the stability of both supersonic and transonic cascades, which was carried out by computing blade lift and moment values as functions of the various blade parameters. F G M

A77-20140 Comparison between theoretical and experimental results of torsional stall flutter of an airfoil. H Tanaka (Tokyo, University, Tokyo, Japan), K Shinohara, and Y Hanamura (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 81-88 10 refs

A theory for analyzing the stall flutter of an airfoil with leading edge separation is outlined which takes into account the unsteady pressure fluctuation behind the airfoil and which can be applied to various points of rotation. Results obtained by this theory are compared with those obtained experimentally in a water tunnel at a Reynolds number of approximately 50,000. Good qualitative agreement is found between the theoretical and experimental results. F G M

A77-20141 Experimental and theoretical investigations of the aerodynamic damping of turbojet rotor blade vibrations. G S Pisarenko, A A Kaminer, and V A Balalaev (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 89-94 7 refs

Test of the aerodynamic damping of turbojet blade vibrations were conducted in subsonic and transonic air streams as well as in water streams. Assuming that the blade cascade can be regarded as a single vibrating blade, aerodynamic damping is determined as the sum of the damping of three vibration modes: bending, torsional, and bending torsional vibrations. B J

A77-20142 Investigation of blade flutter in a subsonic turbine cascade. A Kirschner, G Gyarmathy (Brown, Boveri et Cie AG, Baden, Switzerland), and C Pelet (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 97-104 5 refs

Experiments were performed to measure the aerodynamic damping of a linear subsonic turbine cascade under variable flow conditions for the cases of bending, torsional, and combined vibration modes. Also considered was the effect of relative blade mass and moment of inertia (combined with the variable position of the torsional axis) on aerodynamic damping and the flutter boundary. The development of the amplitudes of vibration, the interblade phase relations, and the modulation of self-excited vibratory motions were also examined. The goal of the analytical effort was to develop a rapid approximate method for analyzing and predicting the aeroelastic behavior of the subsonic cascades. B J

A77-20143 Unsteady aerodynamic forces in a rectilinear cascade of subsonic blades (Forces aérodynamiques instantanées en grille rectiligne d'aubes subsonique). H Loiseau and J Nicolas (ONERA, Châtillon sous Bagneux, Hauts de Seine, France) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 105-114 11 refs In French

The theoretical part of the investigation deals with an infinite rectilinear cascade, a uniform compressible subsonic two dimensional flow, moderate incidence, and pitching or translational oscillation without deformation. The unsteady forces acting on all the blades are computed when one of them is in motion (the canonical configuration). The experimental part consists of wind tunnel measurements (in the free-stream Mach number range of 0.3-0.8) of global forces only on the blade in motion, and of pressure on the blade in motion and on the neighboring fixed blades. Tests were conducted on Pfenniger Sulzer thick airfoils and on NACA 65 A 006 airfoils. B J

A77-20144 Unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow. H Triebstein (Deutsche Forschungs und Versuchsanstalt für Luft und Raumfahrt, Institut für Aeroelastik, Göttingen, West Germany) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 115-122 13 refs

Measurements of the pressure distribution on a staggered plane cascade at zero angle of attack were carried out in a cascade wind tunnel with the purpose of investigating pitching and flapping oscillations at various reduced frequencies and at Mach numbers of 0.2, 0.4, and 0.6. The cascade considered had seven plates and a stagger angle of 60 degrees, the ratio between the plate depth and the plate spacing was 1.6, the individual plates had a depth of 0.08 m and a thickness of 0.006 m. Experimental results confirm that the root singularity at the leading edge and the Kutta condition at the trailing edge represent suitable assumptions for the purpose of the theoretical determination of the pressure distributions. B J

A77-20145 An experiment to measure moment coefficients for aerofoils oscillating in cascade. D S Whitehead (Cambridge University, Cambridge, England), P J Watson, T Nagashima, and R J Grant (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Française de Mécanique*, Special Issue, 1976, p 123-134

A test cascade rig is described which provides a practical way of measuring the moment coefficient for a blade in torsional vibration. The blades in the test cascade are forced to vibrate by electromagnetic exciters, and the moment coefficient is deduced from the aerodynamic moment obtained by subtracting a 'wind-off' strain gauge reading from a 'wind-on' reading. Some typical experimental results are presented which show that available theories provide a satisfactory prediction of the behavior of flat unloaded blade sections. F G M

A77-20146 * Stall flutter and nonlinear divergence of a two-dimensional flat plate wing. J Dugundji (MIT, Cambridge, Mass.) and K Aravamudan (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris,*

France, Oct 18-23, 1976) *Revue Francaise de Mecanique*, Special Issue, 1976, p 135-142 11 refs USAF NASA supported research

Tests were conducted in a small wind tunnel to study the torsional stall flutter behavior of a two-dimensional flat plate wing pivoted about the midchord. The nonlinear static divergence equilibrium properties of the wing were well predicted from the measured static moment characteristics. Large amplitude limit cycles ranging from plus or minus 11 degrees to plus or minus 100 degrees were observed. Stall flutter occurred above a critical value of a reduced frequency of about 2. Self-excitation occurred for initial angles of attack between 0 and 8 degrees. Nondimensional harmonic coefficients were extracted from the free transient vibration tests for amplitudes up to 80 degrees. B J

A77-20147 Experimental aeroelastic investigations on a cascade in compressible flow. P. Bublitz (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Aeroelastik, Göttingen, West Germany) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Francaise de Mecanique*, Special Issue, 1976, p 143-150 21 refs. Research sponsored by the Kraftwerk-Union.

Tests were performed in a high speed wind tunnel on a highly staggered cascade of relatively great solidity in conditions which reproduce the occurrence of violent blade vibrations in the last stage of stationary steam turbines. The design of the test cascade was based on the following assumptions: the worst flow conditions are to be expected in the tip region of the turbine blading, and the strongest stresses of the blades are produced by the unsteady aerodynamic forces also near the tip region. It is found that the last stage of a large turbine can undergo buffet-oscillations before a reduction of mass flow leads to stall. Due to this 'jump' effect, considerable dynamic loads are to be expected when the turbine is operating at or near the critical Mach number. B J

A77-20148 A study on choking flutter. Y. Tanida (Tokyo, University, Tokyo, Japan) and Y. Saito (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Francaise de Mecanique*, Special Issue, 1976, p 151-156.

Tests involving strain-gage measurements and schlieren flow visualization were conducted in a blowdown test facility to study the nature of the choking flutter of an airfoil in transonic compressible flow. The experiment indicates the importance of wall-distance effects on the airfoil instability and shows that the aerodynamic characteristics of airfoil choking in the transonic region are different from those in the subsonic region. The same problem was also investigated by using a finite difference method to solve the one-dimensional unsteady characteristic equations for an airfoil oscillating about its midchord between parallel walls. B J

A77-20151 Flow instability in supersonic compressors in the regime of low compression rate (Instabilités d'écoulement dans les compresseurs supersoniques en régime de faible taux de compression). J. Paulon (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Francaise de Mecanique*, Special Issue, 1976, p 177-184 7 refs. In French.

Experiments were devised to study supersonic flutter in annular transonic compressors operating at excess velocity with an excessively open downstream gating. It is shown that the flutter instabilities

are due to the formation of a recompression shock near the exit of the interblade channels. It is found that either a flow with a conical wave downstream of the cascade or shock waves confined in the channels and leading to separations corresponds to small oscillations of gating sections. Experimental results are interpreted on the basis of a one dimensional flow model. B J

A77-20153 On the unsteady aerodynamic rotor blade loading in a transonic axial flow compressor with steady state inlet distortion. M. Lecht (Deutsche Forschungs- und Versuchsanstalt für Luft und Raumfahrt, Institut für Luftstrahlantriebe, Cologne, West Germany) and H. B. Weyer (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Francaise de Mecanique*, Supplement, 1976, p 18.

A single stage transonic compressor was investigated with a 120 deg screen induced upstream total pressure distortion and a sinusoidal preswirl distortion. By means of a simple method which allows to correlate the measured flow field in front, between, and aft of the compressor stage the sectorwise operating conditions are evaluated and compared with the undistorted overall performance. For 85 percent speed the unsteady response of the rotor blade element at 50 percent height is given in terms of the unsteady lift coefficient versus angle of attack. The attempt has been made for an approach to the theory of a single airfoil subjected to transverse and chordwise gusts. (Author)

A77-20154 Vortex streets in the wakes of subsonic and transonic turbine cascades. O. Lawaczeck, K. A. Butefish, and H. J. Heinemann (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Strömungsmechanik, Göttingen, West Germany) (*International Union of Theoretical and Applied Mechanics and Association Technique pour la Turbine a Gaz, Symposium sur l'Aéroélasticité dans les Turbomachines, Paris, France, Oct 18-23, 1976*) *Revue Francaise de Mecanique*, Supplement, 1976, p 9-16 8 refs.

During the transonic cascade research program in the DFVLR-AVA Göttingen it was found that the wake flow behind the blades of cascades and isolated profiles consists of vortex streets. In the case of a special gas turbine cascade the frequencies and their strength of the vortices were measured in the subsonic and transonic flow regime. A method is described to obtain besides the frequency of the vortices and the corresponding Strouhal number the width of the two vortex rows. These values are given as function of the downstream Mach number and an appropriate Mach number at the trailing edge of the blade. (Author)

A77-20238 Turbulence generated noise on either side of a double layer jet. R. Dash (Indian Institute of Technology, New Delhi, India) *Letters in Applied and Engineering Sciences*, vol 4, Dec 1976, p 431-442 12 refs.

Ffowcs Williams' (1974) extension of Lighthill's (1952) aerodynamic theory has been further developed to study the turbulence generated noise on both sides of a uniformly moving jet flow. An aerodynamic zone of silence bordering the external sides of the vortex interfaces has been predicted. An interesting feature is the distinct structure of the final radiation in the illuminated and shadow zones without any recourse to dimensional analysis. (Author)

A77-20260 Helicopter motion. Equation linearization. A. Fermelia (Hughes Aircraft Co., Aurora, Colo.), D. A. Gyorog (U.S. Army, Rodman Laboratory, Rock Island Arsenal, Rock Island, Ill.), and V. J. Flanagan (Missouri Rolla, University, Rolla, Mo.) *IEEE Transactions on Aerospace and Electronic Systems*, vol AES 12,

Nov 1976, p 767-782 5 refs Research sponsored by the University of Missouri Rolla, U S Army, and NSF

Equations of helicopter motion are linearized about a prescribed nominal state. Once the linearized system of equations is obtained, it is discretized and the output of the nonlinear system is compared to that of its linearized counterpart for validation. The linear model so obtained is then used in investigating the stability and control characteristics of rotorcraft. Three approaches to validation are described: a static check, a homogeneous test case, and an objective function test in which an assigned pseudoflight path is compared to the state generated by the linear system and the error is fed into an objective functional to be minimized. Appendices provide detail on the nonlinear equations of motion, the linearization procedure, life and drag curves, and validation results. R D V

A77-20377 # Fokker-VFW J H de Koomen (Fokker VFW, Schiphol Airport, Netherlands) *Ruimtevaart*, vol 25, Dec 1976, p 22-33 In Dutch

Management of space projects and advances in space technology are reviewed. Space-related activities of the Netherlands Fokker aircraft firm in the pre-ESA period (ESRO, ELDO) and within the framework of ESA programs are recounted, with the Astronomical Netherlands Satellite (ANS) taken as landmark project. Among the Fokker developments sketched in the review are: nutation dampers, components for GEOS, OTS, ARIANE, and Spacelab. Collaboration with ERNO, the German based subdivision of Fokker-VFW, is mentioned. R D V

A77-20439 # Vertical takeoff lift augmentation - The 'sculptured deck' concept P R Greene (Grumman Aerospace Corp., Bethpage, N Y) *Journal of Aircraft*, vol 14, Feb 1977, p 111-114 7 refs

Experimental results are presented which demonstrate that the lift of a hovering VTOL aircraft can be increased greatly by appropriately contouring the ground surface under the vehicle. The augmented lift is created by redirecting the jet exhaust flow so that it impinges on the aircraft underbody. One configuration of the ground plane is shown to augment the total upward force on the vehicle by a factor of 2.4 and at the same time increases the roll, pitch, and yaw stability of the aircraft. The measurements were taken from a particular VTOL model and two types of ground plane, but the idea can be generalized to include arbitrary aircraft planform, any number of jets, any shape jet exit, and a wide assortment of ground plane topographies. The high degree of design flexibility intrinsic to the concept may be sufficient to offset the serious problems of underbody heating, hot-gas reingestion, and the necessity of a prepared takeoff site. A77-20440 # Dynamics of a slung load L Feaster (Massachusetts University, Amherst, Mass., U S Army, Washington, D C), C Poli, and R Kirchhoff (Massachusetts University, Amherst, Mass.) *Journal of Aircraft*, vol 14, Feb 1977, p 115-121 13 refs

The yaw damping coefficient of an 8 x 8 x 20 ft cargo container is experimentally determined by forced oscillation tests. The result is then used in linearized small perturbation stability analyses of a slung load, considering both single-cable and two cable tandem suspension systems. The effect of attaching stabilizing fins to the container and of incorporating a rotating wheel for stability augmentation is also theoretically investigated. The results agree well with previous model and full-scale tests and also show that the two-cable tandem suspension system may offer a satisfactory means of transporting the standard cargo container throughout the speed range of most present day cargo helicopters. (Author)

A77-20441 * # Lateral equilibrium of asymmetrical swept wings - Aileron control vs geometric twist T A Weisshaar (Virginia Polytechnic Institute and State University, Blacksburg, Va) *Journal of Aircraft*, vol 14, Feb 1977, p 122-127 13 refs Grant No NsG-2016

A static aeroelastic phenomenon unique to an aircraft with asymmetrical swept wings is discussed. A simple formula is derived from the analysis of a highly idealized model. The validity of this formula is examined through the use of a more sophisticated numerical analysis. Among the results of this analysis are the following: aileron settings of a few degrees are sufficient to trim such aircraft in roll-for-g-flight, the use of built-in twist in the form of initial negative dihedral provides an efficient alternative to aileron trim, if the wing is elastically tailored in a proper fashion, it may be possible to design a wing whose elastic deformation under airloads provides a form of self-trim in roll at the cruise q of the aircraft. (Author)

A77-20443 # Handling quality criterion for heading control R H Hoh and I L Ashkenas (Systems Technology, Inc., Hawthorne, Calif.) *Journal of Aircraft*, vol 14, Feb 1977, p 142-150 15 refs Contract No F33615-72 C 1456

A heading control criterion based on the aileron-rudder sequencing required to achieve coordinated turns is presented. Quantification of the aileron-rudder shaping is obtained by consideration of the ideal crossfeed which completely eliminates sideslip induced by aileron inputs. The shaping and gain parameters based on this ideal crossfeed are defined and correlated with pilot opinion ratings. Excellent correlation is obtained with data from simulation of STOL, fighter aircraft, and space shuttle vehicles. (Author)

A77-20445 # The scatter factor in the reliability assessment of aircraft structures A M Freudenthal (George Washington University, Washington, D C) *Journal of Aircraft*, vol 14, Feb 1977, p 202-208 11 refs USAF supported research

The lack of reliability of the analytical methods of prediction of fatigue lives of structural parts and complete structures requires the use of 'scatter factors' to be applied to the results of full-scale fatigue tests of aircraft components and of structures under loading representative of conditions of service. An attempt is made to define the scatter factor in probabilistic terms as the ratio between the best estimator of the fatigue life obtained in a small number of tests and the time to the first failure in a fleet of aircraft of specified size, at a specified reliability level. It is shown that with this definition the scatter factor can be related to the result of a single full scale test of a complete structure and associated with a specific reliability level. The effect of the minimum fatigue life on the scatter factor is studied and its significance demonstrated in a set of tables computed on the basis of the derived equations. (Author)

A77-20446 # Application of dimensional analysis to predict airplane stopping distance M K Wahi (Boeing Commercial Airplane Co., Renton, Wash.) *Journal of Aircraft*, vol 14, Feb 1977, p 209-214 9 refs Contract No F33657-74-C-0129

A new technique has been developed to predict airplane braking distance performance in terms of aircraft parameters, runway environment, and brake control systems performance. A dimensional analysis technique was used to determine significant dimensionless groups or π terms required to express the braking performance in equation form. A hardware-analog brake control simulator was used to gather experimental data necessary to determine the constants and exponents in the performance equation. Among the airplanes studied were the Boeing 727, 737, 747, the Lockheed C-141, and the McDonnell F4. A prediction equation permits the calculation of stopping distance, assuming that proper information concerning airplane and weather parameters is available, as well as accurately measured tire runway friction coefficients. (Author)

A77-20448 # Static aeroelastic twist effects on helicopter rotor-induced velocity K S Nagaraja and G A Pierce (Georgia Institute of Technology, Atlanta, Ga.) *Journal of Aircraft*, vol 14, Feb 1977, p 217 219 8 refs

The static elastic twist and the mean inflow velocity distribution are determined by an approximate analytical technique in order to find the unsteady aerodynamic flowfield associated with a helicopter rotor, in hover or in vertical ascent, with low inflow conditions. The inflow velocity thus found is then available for computing the wake spacing needed in arriving at the unsteady airloads. Results based on a linearized solution yield a higher elastic twist distribution than an exact solution derived. The inflow velocity distribution is thus accepted as higher than the exact distribution. R D V

A77-20449 # Airfoil design by optimization P Ramamoorthy (National Aeronautical Laboratory, Bangalore, India) and K Padmavathi (Aeronautical Development Establishment, Bangalore, India) *Journal of Aircraft*, vol 14, Feb 1977, p 219 221 7 refs

An airfoil design technique is described which uses an analytical method for representing the airfoil contour by Wagner functions and a computational procedure for obtaining the values of the coefficients of expansion. The method for approximating an airfoil contour by a Fourier type series of Wagner functions is briefly outlined, and a flow chart for airfoil design by optimization is given. The design technique is validated by applying it to the NACA 0009 airfoil as well as to a typical airfoil that gives a 'roof top' pressure distribution. Advantages of this technique over classical design methods are discussed. F G M

A77-20573 Deutsche Gesellschaft fur Luft- und Raumfahrt, Shell Buckling Meeting, Meersburg, West Germany, April 29, 30, 1976, Reports and Discussion Contributions (Deutsche Gesellschaft fur Luft- und Raumfahrt, Schalenbeultagung, Meersburg, West Germany, April 29, 30, 1976, Vortrage und Diskussionsbeiträge) Edited by M Esslinger and B Geier Braunschweig, Deutsche Forschungs- und Versuchsanstalt fur Luft- und Raumfahrt, 1976 206 p 70 refs In German \$12 35

Buckling loads in the case of axial cylindrical tubes are considered along with buckling tests involving hyperbolic axisymmetric shells, the local load capacity of aircraft components, the carrying capacity of fiber-reinforced plastic panels, welding residual stresses and deformations in the case of the welding of thin-wall shells, and prebuckling forms involving isotropic circular cylinders. Attention is also given to tolerances in container construction, shell buckling and aspects of safety, regulations concerning the buckling of cylinders under external pressure, buckling regulations for isotropic cylinders subjected to an axial load, the numerical determination of the buckling load of hemispheres and calottes with the aid of the multitarget method, and a criterion for the evaluation of the imperfection sensitivity in the case of general shells. A77-20603 Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1976 75 p \$6 10

Papers are presented concerning the theory and practice of advanced displays to be used by pilots in aircraft guidance and control. Relevant flight, engine, and system display requirements are identified. New concepts are outlined which will help refine the still incomplete theory of perception. Featured topics include investigation of the optimum use of advanced displays in future transport aircraft, perception problems related to presentation of information to pilots, and use of advanced aeronautical cartography for improved legibility and effectiveness of graphic displays. S D

A77-20605 # Flight information for airline pilots - The certification angle R Rye and W L Horsley (Civil Aviation Authority, London, England). In: Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings. London, Royal Aeronautical Society, 1976 10 p

An airworthiness authority is required to set minimum standards of airworthiness and to make sure that they are implemented and maintained. The difficulties encountered in setting these standards for information display are discussed. It is recommended to use a warning signal that is compatible both with the cause of its occurrence and with the human limitations of the crew. In particular, it is required to use a central warning panel visible to both pilots with primary and secondary warnings, and a limited number of audible warnings to avoid confusion. The warning should be repeated if the consequences of a wrong selection of control are hazardous. It is also shown that the channels of communication through which line aircrews receive their basic operating data are not working as well as they could, due to discrepancies between the 'development and certification' world and the 'operational' world. The Operations Manual should be recognized as the prime flight deck reference document, required to be carried on the airplane. S D

A77-20606 # Investigation into the optimum use of advanced displays in future transport aircraft R E Hillman (British Aircraft Corp., Ltd., Weybridge, Surrey, England) and J W Wilson (Hawker Siddeley Aviation, Ltd., Hatfield, Herts., England). In: Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings. London, Royal Aeronautical Society, 1976 21 p

The paper discusses potential improvements in flight deck instrumentation as related to flight, engine, and system displays to meet the requirements of next-generation transport aircraft. The proposals take full account of the demonstrated capability for safe two crew operation of transport aircraft along with the frequent comment that in such aircraft the workload is already at the upper acceptable limit in critical conditions. Only the monochrome cathode ray tube is considered to offer an acceptable risk for the advanced display field. The inherent flexibility of electronic displays indicate that further significant improvements are possible through the suppression of untimely or unnecessary information and the consequent integration of relevant data on a smaller display area. S D

A77-20608 # Presenting information to the general aviation pilot A Bramson. In: Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings. London, Royal Aeronautical Society, 1976 9 p

Following a review of the tasks of a single pilot operating a light aircraft on a definite flight mission, the paper examines basic flight, engine, systems, and navigational requirements for the safe and effective performance of a one man crew. Common weaknesses in modern single and twin engine light aircraft are identified. Recommendations are made to help the pilot perform three or more skilled functions simultaneously. Major recommendations call for improved altimeter, color coded instruments whenever applicable, grouping together of all related controls and instruments, a simple fuel selector/fuel gage arrangement, all controls within the reach of the pilot, and improved methods of storing radio frequencies for quick recall to reduce workload. S D

A77-20619 # Remotely piloted vehicles - An Air Force view J Mitchell (RAF, London, England). In: Symposium on RPVs - Roles and Technology, London, England, January 27, 1976, Proceedings. London, Royal Aeronautical Society, 1976 11 p

A description is given of the current operational roles of remotely piloted vehicles (RPV). RPV characteristics are examined, taking into account aspects of vulnerability/survivability, mission effectiveness, data links, guidance and control, and operational command and control. Flight regimes at low altitude, medium altitude, and high altitude are considered. Attention is given to reconnaissance, target acquisition and marking, electronic warfare, weapon delivery, air-to-air combat, defense suppression, RPV operating experience to date in the RAF, RPV problem areas, and the most fruitful areas for further study. G R

A77-20620 # R P V s in the maritime environment K D D Clitherow (Royal Navy, London, England) In Symposium on RPVs Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 8 p

A major threat to ships in the field of above water warfare at sea comes from missiles. A number of approaches utilizing RPVs can be employed in meeting such a threat. Attention is given to questions of target identification, the employment of RPVs for electronic countermeasures designed to destroy or deflect attacking missiles, the use of RPVs in antisubmarine warfare, RPV payloads, and problems related to the transportation of an RPV on a ship. G R

A77-20621 # The R P V in perspective R Melling (Hawker Siddeley Aviation, Ltd, Brough, Yorks, England) In Symposium on RPVs - Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 7 p

The term RPV is used to cover a vehicle which incorporates some combination of remotely piloted, preprogrammed, and autonomous operating facilities. Factors leading to an unmanned aircraft are examined and suitable roles for the RPV are considered. The roles are related to target simulation, general surveillance, specific reconnaissance, artillery spotting, the creation of confusion, and jamming. Research and development problems are also discussed, taking into account engines, sensors, navigation, remote control, the data link, and aspects of launch and recovery. G R

A77-20622 # Remotely piloted vehicles - The influence of system thinking on applied technology A C Wesley (Ferranti, Ltd, Electronic Systems Dept, Edinburgh, Scotland) In Symposium on RPVs - Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 15 p

A description of the characteristics of RPV systems is presented. Both fixed and rotating wing types are used. The range of overall systems extends from single controlled vehicles operated locally to multiple vehicles operated by complex command posts having control of many vehicles which may penetrate deeply into enemy country. Communication techniques and questions of navigation and flight control are also discussed along with electro-magnetic sensors and radar technology, electro-optical sensors, and aspects of data handling and processing. G R

A77-20623 # Convertible aircraft W D Simpson (British Aircraft Corp, Ltd, Stevenage, Herts, England) In Symposium on RPVs Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 14 p

A convertible aircraft is defined as a machine which can be flown manned, but with a manual or remote override so that it may be controlled as an RPV. In addition, it may also be flown unmanned as a conventional RPV. Unmanned convertibles can be controlled either by a ground operator or from a manned convertible. The basic aircraft will be a low cost, light fixed wing machine probably powered by a piston engine. Suitable design characteristics for convertible aircraft are considered. Attention is given to the operational use of convertible aircraft by the Army and the Navy. G R

A77-20626 # The Aerodyne - An R P V with multiple capability A J White (Hawker Siddeley Dynamics, Ltd, Hatfield, Herts, England) and G Harms (Dornier GmbH, Friedrichshafen, West Germany) In Symposium on RPVs Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 21 p

The propulsion system of the Aerodyne uses a gas turbine engine to drive a ducted fan. The static thrust obtained is sufficient to carry the weight of the vehicle. Like the helicopter, the Aerodyne can hover, or take off and land vertically. For forward flight the flaps which direct the fan output are gradually changed to the horizontal. The development of an experimental Aerodyne vehicle by a German aerospace company is discussed. Aerodyne configurations for maritime and battlefield operations are considered and a description is presented of a system concept for battlefield operation. A computer in a command vehicle will be used for picture processing, Aerodyne tracking, mission planning, and for equipment testing and check-out. G R

A77 20627 # Skyspy - A ducted RPV fan H S Ransom (Short Brothers and Harland, Ltd, Belfast, Northern Ireland) In Symposium on RPVs - Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 10 p

The essential elements of Skyspy include a fan, an engine to drive it, a duct enclosing the fan, control surfaces in the jet, and the closed loop control systems and sensors to govern the pitch, roll, yaw, and axial motions of the airframe. The ability of Skyspy to hover or fly at very low speeds is an important factor in operations related to the surveillance of a static or slowly moving objective and search missions at low speeds. Higher forward speeds can be obtained by inclination of the complete airframe. The development of an experimental vehicle is discussed. Attention is also given to the employment of Skyspy as a relay station, details concerning its payload, aspects of vehicle control, and takeoff and landing operations. G R

A77-20628 # B A C experience with small fixed wing and rotary wing R P V s R Stephenson (British Aircraft Corp, Guided Weapons Div, Bristol, England) In Symposium on RPVs - Roles and Technology, London, England, January 27, 1976, Proceedings London, Royal Aeronautical Society, 1976 14 p

A description is given of research programs conducted with the aid of the Big Wig model aircraft. The aircraft has a high wing of 2 meters span and a useful payload of about 2 kg. An investigation of electrostatic autostabilization techniques is reported. Other experiments were related to the use of an optical beam riding system to guide a remotely piloted vehicle. The development of a mini-RPV for surveillance or defense suppression roles is discussed along with the selection of a suitable model for rotary wing development studies. The selected model was modified to improve its payload capacity while retaining mechanical reliability. G R

A77-20629 Inter-noise 76, Proceedings of the International Conference on Noise Control Engineering, Washington, D C, April 5-7, 1976 Conference sponsored by the International Institute of Noise Control Engineering Edited by R L Kerlin (Pennsylvania State University, University Park, Pa) Poughkeepsie, N Y, Institute of Noise Control Engineering, 1976 558 p \$35

The papers deal with recent developments in noise control and techniques for measuring and analyzing noise data. General topics include advanced noise-control techniques, machinery noise reduction at the source, aircraft and airport noise, noise measurement and analysis, reduction of in-plant noise exposure, rail transportation noise, noise control engineering in buildings, materials and products for noise control, traffic noise abatement, community noise, international standards and legislative requirements for noise control, designing and planning for industrial noise control, and effects of noise on the individual and on society. Specific papers discuss

real-time signal processing of noise data using cross property techniques, applications of coherence-function techniques in noise diagnosis and prediction, noise reduction procedures for centrifugal fans, structural acoustical considerations for aircraft, inlet noise reduction for gas turbine engines, requirements for ground-based forward-speed simulation in aircraft noise research, and effects of aircraft noise around several airports

A77-20633 **Structural acoustic considerations for aircraft**
B L Clarkson (Southampton, University, Southampton, England)
In Inter-noise 76, Proceedings of the International Conference on Noise Control Engineering, Washington, D C, April 5-7, 1976
Poughkeepsie, N Y, Institute of Noise Control Engineering, 1976, p 67-72

Acoustic pressure forces loading an aircraft structure, pressure fields close to a jet, jet impingement patterns in externally blown flap configurations, response of certain types of structures to excitation, design of structures to take heavy acoustic loading, and transmission of sound through a fuselage and into a cockpit are discussed. Responses of composite materials, particularly carbon fiber and boron fiber reinforced plastics incorporated into aircraft skin structures, responses of integrally stiffened skin structures or honeycomb skin structures, or of the internal supporting structure or panel structures to the different modes of acoustic excitation are examined.

A77-20634 * **Survey of inlet noise reduction concepts for gas turbine engines**
D L Lansing and D Chestnutt (NASA, Langley Research Center, Hampton, Va.) In Inter noise 76, Proceedings of the International Conference on Noise Control Engineering, Washington, D C, April 5-7, 1976
Poughkeepsie, N Y, Institute of Noise Control Engineering, 1976, p 73-78

This paper presents an overview of advanced concepts for the suppression of noise in the inlets of gas turbine engines. Noise suppression concepts are described, the directions of current research are reviewed, and problem areas requiring further work are indicated. The discussion focuses on acoustic liners, high Mach number inlets, active acoustic absorption, water vapor injection, and blade row reflection.

A77-20652 **Error model of an inertial navigation system for integrated navigation based on adjustment according to the method of least squares (Fehlermodell eines Inertialnavigationssystems für die integrierte Navigation durch Ausgleichung nach der Methode der kleinsten Quadrate)**
D K Joos (Stuttgart, Universität, Stuttgart, West Germany) In Symposium on Gyroscope Technology, Braunschweig, West Germany, March 31-April 1, 1976, Reports
Dusseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1976, p 225-250. 9 refs. In German

None of the many navigational systems currently employed satisfies all the requirements of aviation. The approach of 'integrated navigation' attempts to obtain a significant improvement of navigational accuracy and system reliability by means of a suitable integration of different systems of navigation. The integrated navigation method developed by Ramsayer (1970) is considered. The method is based on an error model of the employed coupled navigation system. The procedure of model parameter determination involves the minimization of the sum of the squares of the differences between measured data and computed navigational parameter values. The parameter estimation procedure is discussed and the error equations are examined. The performance characteristics of the considered model are investigated with the aid of a computer simulation study.

A77-20654 **The employment of the hybrid flight measurement system for measurements related to the study of a microwave**

landing system (Zum Einsatz des hybriden Flugmesssystems bei der Vermessung eines Mikrowellenlandesystems) K Hurrass and B Stieler (Deutsche Forschungs und Versuchsanstalt für Luft und Raumfahrt, Institut für Flugführung, Braunschweig, West Germany) In Symposium on Gyroscope Technology, Braunschweig, West Germany, March 31-April 1, 1976, Reports
Dusseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1976, p 305-328. 10 refs. In German

A novel measurement system for the determination of the reference flight path of an aircraft in connection with the study of the microwave landing system DLS is discussed. The system DLS has been proposed by the Federal Republic of Germany as a possible replacement for the currently used ILS. The discussed flight path measurement system includes three theodolites and a target tracking radar on the ground. The ground sensors are supplemented by measuring devices carried by the aircraft used in the investigations. The onboard devices include an inertial navigation system, a Doppler radar, and a barometric altimeter.

A77-20655 **New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976**
Symposium sponsored by the Institute of Navigation and U S Navy, Washington, D C, Institute of Navigation, 1976. 162 p. Members, \$15, nonmembers, \$20.

The present collection of papers is concerned with advances in aerospace navigation, from the latest aerospace applications of celestial, radio, inertial and satellite navigation to the development of sophisticated navigation systems such as laser gyros. Featured topics include improved navigation using adaptive Kalman filtering, navigation for sea based remotely piloted vehicles, ring laser gyro strap-down systems, and microwave holographic imaging of aircraft with spaceborne illuminating source. Additional developments in software will further improve navigation accuracy in terms of prediction, correction and more complete control of the navigation process.

A77-20656 # **Evaluation of the accuracy of community relative navigation organization concepts**
H J Rome (Lowell Technological Institute, Lowell, Mass.) and J S Stambaugh (Dynamics Research Corp., Wilmington, Mass.) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976.

Washington, D C, Institute of Navigation, 1976, p

4-10

A relative navigation system is one in which each platform determines its position, velocity, and heading with respect to other members of the task force, or community. This type of system, which is based on a TDMA communications network, is a form of communications-navigation identification system. Results are presented for an accuracy evaluation of the various ways in which the navigation function of such a system can be mechanized. A covariance analysis simulator is used to evaluate various organization and mechanical concepts. Two performance measures, relative range and pointing, are shown to define the accuracy of a relative navigation system. It is shown that mechanizations involving one member whose platform is used to define the community navigation coordinate frame generally provide the most precise relative navigation. Stationary references should be included as members of the community if available. Mixing the types of dead reckoning systems in a community can degrade relative navigation performance due to filter modeling errors.

S D

A77-20657 # **Improved navigation using adaptive Kalman filtering**
L Chin and R Kaufmann (U S Naval Material Command, Naval Air Development Center, Warminster, Pa.) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976.

Washington, D C, Institute of Navigation, 1976, p

11-20. 42 refs.

Basic Kalman Filtering is predicated on a knowledge of the statistics of the underlying noise processes. When this information is incomplete or lacking, less stringent assumptions are made and then

adaptive Kalman filtering is applied to the problem. The filter adapts itself to the unknown statistics and generates an improved estimate of the system states. In the development of this method, correlation of the innovation sequence has been studied extensively in the past few years and many theoretical results have been obtained. The application of these results to reduce errors in inertial navigation systems and the advantages and disadvantages are to be studied. This paper examines the implementation of the innovation sequence approach to the solution of the adaptive Kalman filtering problem and the application of it to a typical long-range inertial navigation system with unknown noise statistics in an effort to improve system performance. Results obtained through computer simulation form a basis for discussions which include implementation requirements, effectiveness in estimating reset parameters, and operational advantages and disadvantages.

A77-20658 # The new UTC Time Signals. R. L. Duncombe (Texas, University, Austin, Tex.) and P. K. Seidelmann (U.S. Naval Observatory, Washington, D.C.). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976.

Washington, D.C., Institute of Navigation, 1976, p. 21-24, 6 refs.

Beginning January 1, 1972, the standard time signal broadcasts no longer give directly the rotational position of the earth to an accuracy of 1/10 of a second of time, as had been done previously. Instead, the new UTC (Coordinated Universal Time) Time Signals may depart from the rotational position of the earth by as much as 9/10 of a second. To retrieve the rotational position of the earth to an accuracy of 1/10 of a second, it is necessary to apply a supplementary correction DUT1 (UT1-UTC) which is coded into the time signal itself. Methods for using DUT1 in various applications are reviewed.

A77-20659 # Navigation to surveying accuracy with an inertial system. J. R. Huddle (Litton Systems, Inc., Woodland Hills, Calif.). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976. Washington, D.C., Institute of Navigation, 1976, p. 25-32, 19 refs.

The inertial surveyor is a self-contained system regarded as a black box which is conveyed from point to point over the earth surface via helicopter or land vehicle, providing automatically position, azimuth and gravity disturbance measurements. The paper traces the development of the inertial survey system and describes the present configuration and its theory of operation for position survey. The discussion covers effects of system random errors, correlation of velocity and position error in open traverse, effects of systematic errors, and nature of residual survey error after traverse closure. The accuracy that the system should be capable of achieving in the near future as derived from analysis is presented, and the probable developments to expect in inertial surveying in the future are discussed.

S D

A77-20662 + Navigation for sea based RPVs. L. Newman (U.S. Naval Material Command, Naval Navigation Laboratory, Warminster, Pa.). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976. Washington, D.C., Institute of Navigation, 1976, p. 48-51.

Navigation instrumentation is necessary for each mission of sea based remotely piloted vehicle (RPV). The paper examines the impact of each phase of the mission, including launch at sea, traversal to the operations area, critical mission flight operations, and at sea recovery. Constraints resulting from the use of existing navigation techniques are identified. Launched from a carrier, RPV navigation systems requiring preflight data loading and initialization procedures have the benefit of support systems available for similar functions aboard manned aircraft. The journey to the operations area may be navigated using a variety of methods ranging from remote control for line-of-sight operations to completely preprogrammed flight controls

for over-the-horizon traversals. Included in the discussion are additional design requirements and limitations on RPV navigation system alternatives. It is concluded that the constraints and requirements peculiar to sea-launched RPVs will challenge the limits of the state of the art of navigation.

S D

A77-20663 # Advanced development program for the ring laser gyro navigator. K. L. Bachman (U.S. Naval Material Command, Naval Air Development Center, Warminster, Pa.) and E. W. Carson (Honeywell, Inc., St. Louis Park, Minn.). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976.

Washington, D.C., Institute of Navigation, 1976, p.

52-58.

Results are presented for an advanced development program designed to provide base line data from which ring laser gyro strapdown production systems can be developed to achieve the maximum cost-of-ownership benefits possible with this new technology. It is shown that the ring laser gyro, with an inherent digital output and essentially unlimited input capability, provides an ideal solution for the strapdown gyro dynamic range problem. The paper gives the functional description of an advanced development model for the ring laser gyro navigator consisting of an internal navigation unit (INU), control display unit (CDU), mode select unit, and battery. The INU provides position, velocity, and attitude information to the CDU and other aircraft systems. The INU consists of three orthogonal body mounted laser gyros and accelerometers, a digital computer, I/O electronics, sensor electronics, and a power supply. Particular attention is given to the inertial sensors, electrical design, packaging configurations, software, and reliability and maintainability.

A77-20665 " A modular fail op fail safe strapped-down navigator. C. R. Giardina (Singer Co., Kearfott Div., Wayne, N.J.). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976. Washington, D.C., Institute of Navigation, 1976, p. 69-74, 9 refs.

A redundant modular ring laser strapdown navigation system is presented with a full fail op fail safe capability. Fail op fail safe is a term used to denote a system which will fully operate even after any two hard component failures have occurred or after any one soft and one hard (in that order) component failures have occurred. The complete Modular Building Block Approach is used along with the application of a sequential multiple classification technique for sensor failure detection and isolation. Reliability is found as a function of component reliabilities, probability of false alarm errors and probability of undetected failure errors.

A77-20667 # A proposition for an advanced aircraft navigation system for civil air transport. G. Collin and J. B. Rigaudias (Compagnie Nationale Air France, Direction du Developpement Technique, Orly Aerogare, Val-de-Marne, France). In: New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976.

Washington, D.C., Institute of Navigation, 1976, p.

80-85, 9 refs.

The paper shows that an advanced integrated aircraft navigation system should take into account network extension, aircraft flexibility, productivity improvements, air traffic system constraints, cost effectiveness, safety, and frequency spectrum constraints. The main improvements in takeoff are discussed relative to bad weather conditions, aborted takeoff decision, and rotation control. Navigation aspects in climb, cruise, and descent are examined in terms of accuracy capability and versatility. Approach and landing are considered for routine autoland, all weather operations, and pitch control. The proposed cost effective integrated navigation system is based on advanced distance measuring equipment (DME), advanced inertial navigation system (INS), and augmented instrument landing system (ILS). Advanced DME implies improved accuracy and capacity, repetitive coded message, channel listening, advanced INS

comprises low cost through strapdown mechanization and improved gyros, and augmented ILS incorporates smoothing and independent landing monitor, both based on INS Major advantages of such a system are noted S D

A77-20668 # Automated Terminal Service A G Zellweger and E J Koenke (FAA, Washington, D C) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 86-90

It is projected that 65 nontower airports will become tower candidates in the next ten years Substantial savings in operation and maintenance costs can be realized by delaying the installation of these towers by providing comparable tower service with an Automated Terminal Service (ATS) Concept definition and simulation of an ATS system have been completed and have received highly favorable pilot reaction Currently a test bed, consisting of a monopulse beacon Interrogation system, a minicomputer, a voice response system, and an ATC controller display, is being constructed Actual flight tests to determine the feasibility of the ATS concept will begin in the latter part of this year Studies to determine the cost effectiveness of ATS, to develop criteria for installing ATS at airports, and to define the detailed interface of ATS and the ATC system are underway (Author)

A77-20669 # Automatic flight inspection of radio navigation facilities B Litman (Ambac Industries, Inc, Garden City, N Y) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 91-96

Ground radio navigation aids provide the principal means of navigation for all aircraft in the national airspace system The current standard systems are VHF Omnidirectional Range and Tactical Air Navigation which provide bearing and distance information for enroute operation, and instrument landing system which provides high accuracy bearing and elevation with respect to individual runways The paper describes an automatic flight inspection system incorporating the advantages of several technologies that have become available for aircraft use An inertial navigation system, updated by a suitable distance measuring equipment ranging and other fixes, provides precise position An airborne general purpose digital computer does all analysis and provides all control of the system Display terminals are intended to present summary answers and provide operator interface with the system control Relatively untrained crews may be used since flight maneuvers, data analyses, and determination of acceptability are all performed by the computer S D

A77-20670 # Correlation velocity sensor F B Snyder (U S Naval Material Command, Naval Navigation Laboratory, Warminster, Pa) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 97 101C

A new technique for measuring aircraft velocity, the correlation velocity sensor, is being developed Feasibility of this technique was demonstrated through use of rudimentary experimental equipment that received extensive flight evaluations When compared to present Doppler velocity sensors, the correlation velocity sensor promises improved performance over smooth water as well as reduced acquisition and total life cycle costs Test data on the correlation equipment investigated are included (Author)

A77 20672 # VTOL landing aid using low frequency near field techniques F H Raab (Polhemus Navigation Sciences, Inc, Burlington, Vt) In New frontiers in aerospace navigation, Proceed

ings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 109-116 14 refs

A low frequency near field technique similar to that used in the SPASYN system can be used to make a precise, all weather landing aid for VTOL aircraft This system measures both position and orientation at all elevations and azimuths and has an operating range of up to 4 km The ground-based transmitter applies a nominal 200 watt signal to each of three orthogonal loop antennas which are buried in the landing pad or which are located nearby The carrier frequency is in the 1 to 10 kHz range and is modulated to provide for timing synchronization and multiplexing of the signals from the three antennas Coherent frequency shift keying allows transmission of identification, field strength and distortion information, and other useful data The receiver also employs a three-axis H field antenna and uses clipping or editing of impulsive VLF noise to improve the signal to noise ratio, as in an omega receiver Coherent detection is used to measure the signal components induced in each receiving antenna by each transmitting antenna, and position and orientation are computed digitally This system is easily interfaced or combined with omega and loran receivers (Author)

A77 20673 # Three frequency difference OMEGA R G Brown (Iowa State University of Science and Technology, Ames, Iowa) and R L VanAllen (USAF, Washington, D C, Iowa State University of Science and Technology, Ames, Iowa) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 117-124 9 refs Research supported by the Iowa State University of Science and Technology

A formula is presented for computing group delay synthetically from phase measurements made at three frequencies Wave theory indicates that the group delay calculated at the appropriate frequency should be relatively insensitive to the usual diurnal phase variations This is demonstrated with actual three-frequency phase data for the Trinidad North Dakota path The amount of data analyzed is too small to make positive comparisons with composite and other OMEGA configurations, but it is cautiously speculated that the resultant system accuracy using a calculated group delay would be comparable to composite OMEGA (Author)

A77 20674 * # Simulation analysis of a microcomputer-based, low-cost omega navigation system R W Lilley and R J Salter, Jr (Ohio University, Athens, Ohio) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 125 131 7 refs Grant No NGR 36 009 017

A status report is presented on a proposed low cost Omega Navigation System (ONS) based on a microcomputer (Available commercially) Minimum hardware and maximum software are designed for Electronic subsystems are discussed in detail, with block diagrams of the receiver and microcomputer interface modules, and a flowchart of the automatic synchronization process The system is designed as a precision navaid for general aviation in the \$1000 price range R D V

A77 20675 # Application of the Global Positioning System as an attitude reference for near earth users V W Spinney (Rockwell International Corp, Autonetics Group, Anaheim, Calif) In New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa, April 27, 28, 1976 Washington, D C, Institute of Navigation, 1976, p 132 136

The NAVSTAR Global Positioning System (GPS) is a satellite based navigation system that will provide very accurate three-dimensional position fixing and timing information to properly equipped users, at all times, on or near the earth This paper examines a unique application of the GPS, wherein interferometer

principles employed in a multiple antenna configuration operate on selected incoming satellite signals to determine three dimensional attitude of the user system. The basic measurement entity is the satellite signal phase shift differential (i.e., range difference) between an antenna pair and a single satellite. A minimum of three antennas and three satellites results in six independent differential measurements from which the orientation of the antenna triad in an earth-fixed coordinate set is readily determined. The basic attitude solution algorithm is developed, including a least-squares implementation for the overdetermined case with four operational satellites. The user receiver measurement requirements commensurate with desired attitude accuracy are presented. Attitude accuracy sensitivity to such factors as antenna calibration errors, absolute position uncertainty, and geometric dilution of precision are also examined. (Author)

A77-20676 # A navigation algorithm for the low-cost GPS receiver. P. S. Noe (Texas A & M University, College Station, Tex.) and K. A. Myers (USAF, Avionics Laboratory, Wright Patterson AFB, Ohio). In *New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976*. Washington, D.C., Institute of Navigation, 1976, p. 137-141. 8 refs. Contract No. F44620-75-C-0031.

The Global Positioning System (GPS) is a satellite navigation system currently under development by the Department of Defense. A previous note described the numerical properties of a proposed navigation algorithm for the low-cost GPS receiver under static conditions. This note evaluates performance of the algorithm in a realistic dynamic simulation of a typical flight profile for an Air Force C5A transport aircraft. Numerical convergence and long term dynamic stability of the algorithm are demonstrated in a noise-free environment; typically, a single iteration of the algorithm maintains position estimate errors below 0.2 ft at each position fix for the duration of the flight. Stochastic error models are implemented in the simulation to produce a realistic noisy environment; in this case, the algorithm provides navigation accuracies on the order of 400 ft. In addition, the performance of two GPS satellite selection routines is compared in the simulations. (Author)

A77-20678 # Dual INS velocity error reduction through new damping techniques. L. Newman (U.S. Naval Material Command, Naval Navigation Laboratory, Warminster, Pa.). In *New frontiers in aerospace navigation, Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976*. Washington, D.C., Institute of Navigation, 1976, p. 148-155.

Three alternative configurations for the reduction of velocity errors in dual inertial navigation systems through automatic feedback loop damping are considered. These are (1) independent INS, in which one can, by keeping one system heavily damped, control reference velocity sensitivity while simultaneously retaining heavy damping on the indicated position; (2) INS velocity damped acceleration, which can be used to achieve improved gravity response with negligible reference velocity sensitivity penalty in a navigation suite with limited reference velocity errors; and (3) INS minus reference velocity damped acceleration with INS position damped velocity, which provides excellent gravity error control for systems with limited reference velocity errors. B. J.

A77-20690 Processor system configuration in the NOE helicopter environment. E. L. Griffin (Martin Marietta Aerospace, Orlando, Fla.). In *Annual Southeastern Symposium on System Theory*, 8th, Knoxville, Tenn., Apr. 26, 27, 1976, Proceedings. New York, Institute of Electrical and Electronics Engineers, Inc., 1976, p. 314-318. 10 refs.

Several possible configurations exist for the processing system that integrates the avionics and visionics subsystems for the night mission nap-of-the-earth (NOE) military helicopter. The military helicopter computational system must be lightweight, low cost, highly reliable, and easily maintained. Enemy small arms fire is included as part of the reliability environment. The discussion covers system environment and utilization, alternative system configurations, processing system analysis, and candidate system evaluation. Evaluation matrix results indicate that the selection of a Schottky central microprocessor configuration is the best for the NOE helicopter, and that the dual Schottky centralized processing system is the best candidate when a single-hit survivability is required. S. D.

A77-20716 # Aerodynamic design. I. H. Rettie (Boeing Co., Seattle, Wash.). In *Air transportation for the 1980's*. College Park, Md., University of Maryland, 1976, p. 115-152.

It is suggested that the following six factors will predominate in shaping the aircraft of the 1980s: (1) costs (production, ownership, and operating), (2) fuel economy, (3) cruise speed capability, (4) community noise, (5) passenger comfort, and (6) cargo capability. Aerodynamic design technology (implying wind tunnel testing) at Boeing is considered, giving attention to the use of the TEA 230 computer program for aerodynamic analysis (applied for example to wing flap design and to wing fin tip design). The configuration of the B7X7, typical of new aircraft to be introduced at the end of this decade, is examined. B. J.

A77-20718 # Structures and materials. M. Stone (Douglas Aircraft Co., Long Beach, Calif.). In *Air transportation for the 1980's*. College Park, Md., University of Maryland, 1976, p. 227-264. 6 refs.

The perspectives of aircraft materials and structures in the 1980s are considered with reference to work being done and foreseen at McDonnell Douglas. Structural improvements are to focus on advanced composites, improvement in metal construction, bonding, and active controls at a lower cost. Attention is also given to fracture control and to the applications of computer analysis to structural design. In particular, a structural advanced design technique is considered which uses computer methods for structural modeling (G4GA), aerodynamic loading (MALS), and static strength optimization (ARROW). B. J.

A77-20719 # Effects of artificial stability on configuration design. R. H. Lange (Lockheed Georgia Co., Marietta, Ga.). In *Air transportation for the 1980's*. College Park, Md., University of Maryland, 1976, p. 265-316. 11 refs.

The use of active controls for maneuver load alleviation in the development of transport aircraft in the 1980s is considered. As part of the NASA Advanced Transport Technology Program, Lockheed conducted a relaxed static stability analysis including an assessment of the benefits to be derived from the application of advanced technologies such as low noise level propulsion systems, supercritical wing, advanced filamentary composite materials, and active controls. Attention is also given to the JetStar redesign study, taking account of wing optimization, geometry constraints, and loads analysis. B. J.

A77-20720 # Advanced helicopter designs. R. F. Donovan (United Technologies Corp., Sikorsky Aircraft Div., Stratford, Conn.). In *Air transportation for the 1980's*. College Park, Md., University of Maryland, 1976, p. 317-352.

The three basic parameters which the helicopter designer can trade-off are discussed: disc loading, blade loading, and power loading. Attention is given to the mechanical design of a helicopter with emphasis on the rotor blade, antifriction bearings, the tail rotor, and the use of the bi-filar vibration absorber. Forthcoming and conceptual designs are examined including the Army Utility Tactical Transport and the S-76 helicopter. B. J.

A77-20724 # An automatic-control air-jet propelled ACV
A Magazzu (Palermo, Universita, Palermo, Italy) *Hovering Craft and Hydrofoil*, vol 16, Nov 1976, p 13-21, 27 9 refs

An automatic control system for marine ACVs is suggested with aim of improving their seaworthiness. Control is based on the modulation of the air-flow escaping from the air cushion. The considerable air flow required is utilized for propulsion purposes. A theoretical study of the system is made and, for the two-dimensional case, the equations are worked out for motion in a rough sea. Finally, a numerical analysis is carried out, the results of which appear satisfactory. The preliminary experiments in an especially designed test facility are well in compliance with theoretical expectations. Extensive laboratory tests are at present in progress.

A77-20867 # Attitude control of a pilotless aircraft by radioactive probes (Contrôle d'attitude d'avion sans pilote par sonde radioactive) J L Boulay and S Larigaldie (ONERA, Châtillon sous Bagneux, Hauts de Seine, France) (*NATO, AGARD, Reunion sur l'Instrumentation et le Guidage des Avions sans Pilote, Florence, Italy, Oct 4-8, 1976*) *ONERA, TP* no 1976 112, 1976 11 p. In French

The servocontrol of the attitude of an RPV can be based on the natural electric field within the atmosphere. The vehicle movements are detected, around the roll and pitch axes, by means of radioactive probes installed at the wing tips and at the front and back ends of the fuselage. The electric signals provided by these probes are preprocessed, then mixed with the orders from the ground and directed to the aircraft servocontrols. The study presented in this paper is mainly oriented towards the understanding of the physical mechanisms intervening in the use of radioactive probes, and on the perturbations due to spurious electric charges generated by the engine exhaust gases.

A77-20868 # Methods and techniques of vibration testing in flight (Methodes et techniques de l'essai de vibration en vol) G Piazzoli (ONERA, Châtillon sous Bagneux, Hauts de Seine, France) (*NATO, AGARD, Symposium sur les Techniques d'Essais en Vol, Porz-Wahn, West Germany, Oct 11-15, 1976*) *ONERA, TP* no 1976 120, 1976 10 p. 14 refs. In French

Some general considerations are presented on the importance of flight tests in aeroelastic research. Three methods for examining the subcritical dynamic stability of aircraft are considered: those of harmonic, pulsed, and random vibration testing in flight. Different techniques for excitation of vibration, and for measurement and signal processing are examined along with methods of computer processing and analysis. Vibration tests on aircraft of different types: light aircraft, subsonic transport, and Concorde are described.

A77-20870 # Pressures over a sharp edged air intake functioning in subsonic flow at reduced flowrate (Pressions sur une carene de prise d'air a levre mince fonctionnant en subsonique à débit réduit) G Laruelle and P Levart (ONERA, Châtillon sous Bagneux, Hauts-de-Seine, France) (*NATO, AGARD, Symposium on the Prediction of Aerodynamic Loading, NASA Ames Research Center, Moffett Field, Calif, Sept 27-Oct 1, 1976*) *ONERA, TP* no 1976-127, 1976 13 p. In French

A wind tunnel test set up has been designed for studying the flow around the cowl with sharp leading edge of an air intake functioning at subsonic velocity and with a reduced flowrate. A comparison of the pressure fields around the intake lip, calculated in an approximate configuration for free flight and for that particular set up, shows that local flows are correctly simulated in the case of moderately reduced flowrates. The forces acting on the air intake casing are dependent upon a separation bubble that forms on the external lip of the intake when the flowrate is sufficiently reduced.

Probe measurements performed along the external surface of the cowl make it possible to characterize the profile and thickness of the boundary layer, which is dependent on the bubble wake. Fast response pressure measurements and a film of schlieren pictures reveal the unsteady character of the leading edge separation.

A77-21320 Shaping the flight behavior of the 747SP J Waddell (Boeing Commercial Airplane Co., Renton, Wash.) *Shell Aviation News*, no 438, 1976, p 22-25

Simulation testing and flight testing of the Boeing 747SP, a modified 747 with 47 ft of length removed, is described. Design modifications imposed by the length alteration and the requirement of handling characteristics identical with the 747 are discussed, along with the input of the author and other pilots in adjusting the simulator facility for the program. Modifications of the rudder, trailing edge flap system, some control surfaces, and re-indexing of the hydraulic artificial feel are mentioned. Unusual climb ability is noted; the 747SP can climb 5000 ft higher than any other turbojet airliner on a typical mission (To 39,000 ft, and even to 45,000 ft after sufficient fuel is burned off). Stall tests, including tests with the stick full back, cross-wind landings, and approach operations are described.

A77-21324 # Aircraft design 40 years after Juan de la Cierva (El proyecto de aeronaves 40 años despues de Juan de la Cierva) J L Lopez Ruiz (Construcciones Aeronauticas S A, Escuela Tecnica Superior de Ingenieros Aeronauticos, Madrid, Spain) *IAA/Ingeniería Aeronáutica y Astronáutica*, vol 28, Nov 1976, p 13-24. In Spanish

Aircraft design methodology, effects of computers on design practice, new developments in various fields (aerodynamics, propulsion, materials and structure, stability and control, on-board electronics and instrumentation) aiding aircraft design, aircraft industry trends, and aircraft design in Spain are reviewed. A flowchart is presented of recommended design steps, a table of computers in aeronautical design service in West European nations is provided, and the fact that computers do not resolve all problems in aircraft design is underlined. Steps to promote better organization of design work in Spain are outlined.

A77-21421 # Precision DME for future landing systems - One solution H Vogel (Standard Elektrik Lorenz AG, Stuttgart, West Germany) *Electrical Communication*, vol 51, no 4, 1976, p 249-253. 6 refs

The paper shows that the recently designed L-band DME system is and will be in the near future an optimum solution as regards the number of channels, the available bandwidth, and present technology. Flight tests have indicated that the distance measuring accuracy specified by ICAO for future landing systems can be achieved without modification to the internationally standardized DME specification. Problems that should be solved in order to increase the accuracy of an L-band DME system are identified. In particular, equipment measuring errors are discussed along with errors caused by interfering reflections.

A77-21423 # Communications with aircraft via satellite R Aubelle and H Haberle (Standard Elektrik Lorenz AG, Stuttgart, West Germany) *Electrical Communication*, vol 51, no 4, 1976, p 264-269. 7 refs

Effective surveillance of air traffic in large areas and control by a ground station presupposes long-range information transmission, which can be fulfilled by satellite communications. A system configuration for data and voice communications with aircraft via satellite is proposed which is typical for present air space surveillance. The proposed system for communications between a ground

station and aircraft is also applicable to communications between ships and one or more ground stations. Proposals for multiple access network are discussed S D

A77-21586 Report concerning the status of the selection procedure for a new approach and landing system /MLS/ (Bericht über den Stand des Auswahlverfahrens für ein neues Anflug- und Landesystem /MLS/) Mr. Bohr (Bundesanstalt für Flugsicherung, Frankfurt am Main, West Germany) *Ortung und Navigation*, no 4, 1976, p 71-74. In German

Five proposals for a new landing system, which will replace the currently employed ILS, have been submitted to the All Weather Operations Panel for an evaluation study. The French proposal was not further investigated because the system considered in it with its more global characteristics does not correspond to the properties envisaged for the ILS successor system. The proposals submitted by the US and Australia have, in practice, been combined to one system design. There are, therefore, still three system configurations in competition, including the US-Australian Time Reference Scanning Beam approach, the Doppler-Microwave Landing System of Great Britain, and the DME Landing System of West Germany. Developments related to the evaluation and the comparison of the three systems are discussed G R

A77-21587 Measures for enhancing safety in general aviation in the areas of air traffic control, navigation, and meteorology (Massnahmen zur Erhöhung der Sicherheit der allgemeinen Luftfahrt auf dem Gebiet der Flugsicherung, Navigation und Meteorologie) D Brunner (Braunschweig, Technische Universität, Braunschweig, West Germany) *Ortung und Navigation*, no 4, 1976, p 99-108. In German

Two significant accident categories in the case of general aviation are related to landing accidents and bad weather accidents. An examination of the bad weather accidents shows that in the majority of cases the aircraft involved had the navigational equipment which would have made it possible to avoid the accident by continuing the flight according to instrument flight rules. Measures for enhancing safety in general aviation should, therefore, give particular attention to an improvement of the training of the pilot. Short-term, intermediate-term, and long-term approaches for improving the capability of the pilot are discussed G R

A77-21592 Today's system - Inertial Omega (Le système d'aujourd'hui - Oméga inertie) P Hugon *Navigation* (Paris), vol 25, Jan 1977, p 45-57. In French

Hybrid navigational systems incorporating an Omega receiver and a backup system (Doppler radar, satellite receiver, VOR DME type azimuth-distance system) are discussed, the need for such systems is expounded, information processing in such hybrid systems, and low-cost alternatives to inertial techniques are discussed and evaluated. The AN/ARN 115 and ONS 201 systems are considered as non inertial alternatives. Routes can be traced on the basis of data from two Omega networks alone, and formulas and errors for the procedure are discussed R D V

A77-21593 Regulation of the air traffic control system (La régulation dans le système de contrôle du trafic aérien) J F Vivier *Navigation* (Paris), vol 25, Jan 1977, p 82-97. In French

Major tasks of an air traffic control (ATC) system are reviewed, and charts are provided of decision loops and system control loops. Demand and capacity, local or global, of ATC systems are discussed along with hierarchy of priorities, rate of arrivals, and conditions of arrivals (presence of prior arrivals on runway) are discussed. Conditions uprange and downrange of approach markers and their effect on ATC system performance are dealt with R D V

A77-21594 The aero engine and its progress. Fifty years after Griffith. F W Armstrong (National Gas Turbine Establishment,

Farnborough, Hants, England) *Aeronautical Journal*, vol 80, Dec 1976, p 499-520. 25 refs

After a historical review of the development of gas turbine aero-engines during the last 50 years and a discussion of Dr A A Griffith's contributions, the paper considers the present status of aero engine technology and the shape of its future evolution. The vital role of the powerplant in the development of aviation is stressed, noting the use in large commercial subsonic transport aircraft of the RB 211 engines, the military supersonic combat aircraft with Spey engines, and the helicopters with Gem shaft power engines. The turbofan engines which operate high pressure ratio single fans, and have tip speeds within the region of 450 m/s are outlined and the improvements in both thermal and propulsive efficiency in subsonic flights since the inception of jet propulsion, are noted. The high performance powerplants of the three major combatant classes of the military aircraft are also discussed with general emphasis on their life-cycle cost reduction. The evolution of the VTOL concept and the description of commercial engines are also included A Y

A77-21683 Aircraft identification by moment invariants S A Dudani (Hughes Research Laboratories, Malibu, Calif.), K J Breeding, and R B McGhee (Ohio State University, Columbus, Ohio) *IEEE Transactions on Computers*, vol C-26, Jan 1977, p 39-46. 17 refs. Grant No AF AFOSR-71 2048

Although many systems for optical reading of printed matter have been developed and are now in wide use, comparatively little success has been achieved in the automatic interpretation of optical images of three-dimensional scenes. This paper is addressed to the latter problem and is specifically concerned with automatic recognition of aircraft types from optical images. An experimental system is described in which certain features called moment invariants are extracted from binary television images and are then used for automatic classification. This experimental system has exhibited a significantly lower error rate than human observers in a limited laboratory test involving 132 images of six aircraft types. Preliminary indications are that this performance can be extended to a wider class of objects and that identification can be accomplished in one second or less with a small computer (Author)

A77-21755 # CCVs - Active control technology creating new military aircraft design potential. M A Ostgaard and F R Swortzel (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, Ohio) *Astronautics and Aeronautics*, vol 15, Feb 1977, p 42-51. 10 refs

Advanced flight control technology is continuing to emerge as a substantial driver in the design optimization of both future military and civil aircraft. Inclusion of the flight control system specialist with specialists in structures, aerodynamics and propulsion during preliminary design produces a synergistic benefit. This design philosophy has become known as the control configured vehicle (CCV) approach to design, or the application of active control technology. Results are presented of the LAMS (Load Alleviation and Mode Stabilization) concepts as applied to the B-52 aircraft for analysis, development, and flight demonstration. The potential of active control is also assessed. It is shown that a new generation of fighting aircraft can be the product of military R&D on integrated displays, control, and weapon-delivery systems S D

A77-21869 # Radiocommunication in air navigation. H A Laett (Radio-Suisse, Ltd, Berne, Switzerland). In World telecommunication forum, Technical Symposium, Geneva, Switzerland, October 6-8, 1975, Proceedings. Geneva, International Telecommunication Union, 1975, p 35-213523

The requirements and constraints an air navigation system must satisfy and the technical and operational environment it must work in are considered. The distinction between auto-navigation and apo-navigation is discussed. Typical examples of the former are

examined including the automatic direction finder, VOR, DME, and ILS. Apo-navigation, primarily radar, is discussed with emphasis on MTI and secondary surveillance radar. It is concluded that present air navigation systems are inconsistent and incongruous, but that any enhancement is slow and painful, and must be done with the highest integrity. B J

A77-21874 # Predicting the loading of tail planes in the preliminary phase of aircraft design (Sulla previsione del peso degli impennaggi nella fase preliminare del progetto dei velivoli) S Chiesa and G Guerra (Torino, Politecnico, Turin, Italy) *Ingegneria*, Nov-Dec 1976, p 317-325 18 refs In Italian

Statistically derived formulas for estimating the load on aircraft tail planes early in project design are studied, with a review of the pertinent literature. An analytical technique for deducing horizontal tail load is worked out. The influence, by no means negligible, exerted by static and dynamic compensation masses can be evaluated by proceeding to calculate loads on the structure separately, and then deducing the weight of the masses in question in sequence. R D V

A77-21876 # Improvement of the structure-dynamical properties of aircraft with CCV systems (Verbesserung der strukturdynamischen Eigenschaften von Flugzeugen mit CCV-Systeme) H Zimmermann (Vereinigte Flugtechnische Werke-Fokker GmbH, Bremen, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-237* 25 p 7 refs In German

A description is presented of the CCV technologies ride quality control, maneuver load control, gust load alleviation, fatigue reduction, and flutter control. The considered approaches provide a means to reduce stresses on the aircraft and its human occupants. Accelerations are reduced, the operational life of the aircraft is enhanced, and dynamical instabilities are transferred to higher speeds. Significant results and conclusions regarding the considered technologies are presented and the obtained improvements of the structure dynamical performance are discussed. G R

A77-21877 # Direct side force control - Possibilities and problems of an application in the case of fighter aircraft (Direkte Seitenkraftsteuerung-Möglichkeiten und Probleme eine Anwendung bei Kampfflugzeugen) H Wunnenberg and G Sachs (Dornier GmbH, Friedrichshafen, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-239* 28 p 12 refs In German

Investigations concerning the possibility of an application of direct side force control (DSFC) techniques in the case of the Alpha-Jet are reported. The principles of operation of DSFC devices are examined, taking into account the application of a side force as a means to obtain lateral acceleration for a directional change of the flight path or a lateral displacement. A brief description is presented of wind tunnel studies of a number of principal DSFC design solutions for the Alpha-Jet. Attention is given to simulation tests carried out with the objective to determine the limits for the technical boundary conditions of hardware implementation. Unsolved problems are also considered along with future investigations. G R

A77-21878 # Realization problems concerning reliable CCV flight guidance systems (Realisierungsprobleme von zuverlässigen CCV-Flugführungssystemen) W Meyer (Bodenseewerk Gerätetechnik GmbH, Überlingen, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-243* 16 p In German

Realization problems concerning reliable CCV flight guidance systems related to mission performance in the case of two failures are currently satisfied with the aid of quadruplex systems. System realization possibilities involving the use of concepts of proven

reliability are discussed, taking into account a pure quadruplex system, a quadruplex electronic system with a triplex regulation system, and a digital quadruplex system with integrated monitoring function. Relations concerning the economics of analog and digital systems are presented in a graph. Realization possibilities with future reliability concepts are considered, giving attention to aspects of failure self-detection in automatic flight guidance systems, a programmable automatic supervisor system, and dissimilar redundancy concepts. Possibilities regarding an occurrence of systematic error and software errors are also explored. G R

A77-21879 Possibilities and solution methods of CCV technology (Möglichkeiten und Lösungsansätze der CCV-Technologie) G Lobert (Messerschmitt Bolkow-Blohm GmbH, Ottobrunn, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-236* 86 p 19 refs In German (MBB-UFE-1262-O)

Questions of artificial longitudinal stability are investigated, taking into account aspects of two-dimensional flow, three-dimensional flow, the dimensioning of the elevator unit, and the effect of aerodynamic improvements. Approaches for obtaining artificial lateral stability are discussed along with problems of active flutter control. Attention is also given to active gust load alleviation, maneuver and gust load control, and direct lift and side force control. A description is presented of a German CCV experimental program which has the objective to prepare the CCV technology for the next generation of military aircraft. G R

A77-21880 Design criteria and characteristics of operational CCV flight guidance systems (Entwurfskriterien und -merkmale operationeller CCV-Flugführungssystemen) R Hotz and G Kissel (Messerschmitt Bolkow-Blohm GmbH, Ottobrunn, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-242* 29 p In German (MBB-UFE-1271-O)

The results of an investigation concerning the reliability of currently used aircraft are briefly considered. It was found that the reliability of the servomotor is the dominant factor for flight safety. Configurational requirements are examined, taking into account the importance of servounits, the role of elements for the detection of failure, and approaches to reduce servounit related difficulties by means of a suitable partitioning of the control surfaces. Requirements regarding the flight guidance system are partly related to a retention of functional capabilities in the case of a component failure, simplicity of maintenance and testing requirements, and an aircraft configuration design which makes it possible to compensate the failure of one control surface with the aid of the remaining control surfaces. G R

A77-21881 # Flight characteristics studies related to the employment of direct power steering in longitudinal motion (Fliegeigenschaftenuntersuchungen zur Anwendung der direkten Kraftsteuerung in der Langsbewegung) D Hanke and H H Lange (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugmechanik, Braunschweig, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-238* 31 p 15 refs In German

The employment of a power control parameter for the improvement of longitudinal aircraft guidance capabilities makes it necessary to extend the currently used flight characteristics criteria. The basic employment possibilities of direct lift control are considered and definitions are presented of additional flight characteristics parameters for coupled and uncoupled flight path guidance. A description is given of flight path tracking tests and ILS landing approaches involving a use of the in-flight simulator HFB 320.

Statistical performance parameters of the pilot aircraft system and a subjective evaluation provided by the pilot are used as evaluation criteria. It is found that an employment of direct lift control leads to an improvement of the flight path guidance accuracy. G R

A77-21882 Maneuver load control and gust load alleviation - Design and application possibilities (Manöverlaststeuerung und Boenerleichterung - Auslegung und Anwendungsmöglichkeiten) U Butter (Messerschmitt-Bölkow Blohm GmbH, Ottobrunn, West Germany) and B Krag (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Ottobrunn, West Germany) *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium CCV-Technologien, Munich, West Germany, Sept 17, 1976, Paper 76-240* 52 p 15 refs In German (MBB-UF-1261-O)

The systems investigated have the objective to reduce the bending stresses of the wing by means of a redistribution of the lift forces and to reduce the acceleration for the pilot's seat with the aid of gust effect compensation measures. Additional flap systems are used for direct lift control. A separate gust control device can be utilized for the regulation of the system components. It is also possible to employ an integrated flight control system for conventional guidance functions and the objectives of maneuver load control and gust load alleviation. G R

A77-21887 Testing equipment available in France for studying aircraft and engine noise (Moyens d'essais existant en France, pour l'étude des bruits de moteurs et d'avions) P Lienard (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) *Association Aéronautique et Astronautique de France and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 5th, Toulouse, France, May 19-21, 1976, Paper 17* p 11 refs In French

An overview is presented of ground testing equipment for studies of aircraft noise and aircraft engine noise. The design of anechoic chambers and various soundproof enclosures, open-air test benches for studying ground effects, a jet silencer test bench, equipment for simulating in flight effects, a rail track 'aerotraine' for testing noise generators at high translational velocity, noise caissons, a siren reverberatory test bench, and a ducted fan facility are described. The article also deals with sound suppression equipment in wind tunnel facilities, an acoustical metrology laboratory, and a quality control bench for acoustical materials. R D V

A77-21893 Techniques employed in analyzing turbojet noise (Techniques utilisées dans l'analyse du bruit des turbo-réacteurs) R Berteloot, J P Bernard, and P Deneuville (SNECMA, Paris, France) *Association Aéronautique et Astronautique de France and Groupement des Acousticiens de Langue Française, Colloque d'Acoustique Aéronautique, 5th, Toulouse, France, May 19-21, 1976, Paper 35* p 6 refs In French

Noise generated by fully assembled turbojet engines and by engine components separately or by mockups and techniques and equipment for isolating and measuring the noise are studied, along with methods for forecasting noise in the case of components difficult to isolate. The design and use of antinoise baffles, directional acoustic antennas, microphonic probes, wall-flush microphones, acoustical telescopes, and other techniques are described extensively. Application of the techniques to separation of noise sources in a CFM56 turbojet engine is described by way of illustration. R D V

A77-21951 Half-plane scattering applied to ILS grading criteria J T Godfrey, H F Hartley, R A Moore (Westinghouse Electric Corp., Baltimore, Md.), and G J Moussally (Westinghouse Electric Corp., Pittsburgh, Pa.) *IEEE Transactions on Aerospace and Electronic Systems*, vol AES-13, Jan 1977, p 2-9 22 refs US Department of Transportation Contract No. FA74WA-3353

A technique for calculating the derogation in the difference in depth of modulation (DDM) signal, used for aircraft glide slope guidance, due to slightly rough ground surfaces is developed. The contributions to the scattered signal from diffuse and specular scatter are treated separately. The diffuse derogation is calculated based on empirical data, and an average variation is presented. The specular contributions to the variation in the signal is calculated based on expanding the half plane diffraction solution in terms of the ground roughness. A specular scattered deviation about the mean signal is then obtained by statistically averaging over normally distributed ground heights. Results of the analysis indicate that substantial relaxation in grading criteria can be effected. (Author)

A77 22002 YC-14 flight test progress report R L McPherson (Boeing Co., Seattle, Wash.) and D Bittenbinder (USAF, Flight Test Center, Edwards AFB, Calif.) *(Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif., Sept 22-25, 1976)* *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 1-7

Preliminary test results on the YC-14 STOL craft are reported (CF-6 engines). The performances of the blowing system for powered lift, the 3-channel digital stability augmentation system, fly-by-wire digital flight control system, blown flaps handling, and thrust reversed landing within 2000 ft are described. Airspeed changes during test flight are recounted, and full-load landings are described. Emergency crew egress was tested by dummy ejection. Flight handling was also monitored by a TV camera mounted in the vertical fin to view the top of the YC-14. Checkout of onboard systems (airstarts, normal and manual landing gear extension, hydraulic and electrical actuation systems, avionics) are mentioned. R D V

A77 22003 YC-15 development and test highlights W R Casey (Douglas Aircraft Co., Long Beach, Calif.) *(Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif., Sept 22-25, 1976)* *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 8-24

The testing program for the YC-15 STOL transport is described. These are the first transports to fly with a supercritical wing, the first to demonstrate externally blown flap (EBF) powered lift, and the first to demonstrate routine STOL maneuvers onto and off a 2000 ft runway. Backside STOL operation (altitude controlled by thrust, airspeed controlled by attitude) and operation of the DLC (direct lift control) spoilers are described. Approach and landing tests, stall tests, engine-out tests in stall and landing, mid-air refueling tests, air parachute drop tests (10 tons, low altitude), and operations off an unimproved airfield are described. R D V

A77-22004 B-1 flight test progress report no 2 E Sturmthal (USAF, Flight Test Center, Edwards AFB, Calif.) and T D Benefield (Rockwell International Corp., El Segundo, Calif.) *(Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif., Sept 22-25, 1976)* *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 25-33

Phase I steps in the testing of the B-1 offensive penetrating bomber are detailed. Three B-1 test prototypes were available for the flight tests, one of them instrumented for offensive avionics integration tests. Tests were run on basic flight systems (automatic flight control, engine air inlet controls, electrical and hydraulic systems) and performance (air refueling, and expansion of air refuel envelope, simulation weapons separation and delivery with scoring by ground radar, blind manual letdown from altitude into terrain following, speeding up to Mach 1.4). Severe engine vibration at 37 Hz and its elimination by rescheduling of the secondary exhaust nozzle area are described. R D V

A77-22005 F-18 multi-mission aircraft G W Lenox (US Navy, National Aircraft Standards Committee, Washington, D C.) *(Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif., Sept. 22-25, 1976)* *Society of Experimental Test Pilots,*

Technical Review, vol 13, no 2, 1976, p 34-41

Progress in the test program is indicated, and important features of the single-seater aircraft-carrier-based fighter bomber designed to supplement, not replace, the F-14 are described. The digitally multiplexed four-wire fly-by wire controls, with mechanical backup to the rolling tail, nonblown flap system, right-to-left quick interchangeability of engines, radar system design, interchangeable three CRT displays with multiple display, target acquisition and lock-on, option information functions, and IR and laser hardware are outlined. The design-to-cost policy, with no cost overruns contemplated, is underlined. R D V

A77-22006 F-5E spin susceptibility test J H Taylor (USAF, Flight Test Center, Edwards AFB, Calif) (*Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif , Sept 22-25, 1976*) *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 43-59

Entry into, and recovery from, spin and stall configurations are tested and reported on. Two spin modes are examined, one aerodynamically recoverable oscillatory mode and a fast flat mode probably not recoverable (on the basis of wind tunnel results and flight test results). Emphasis was placed on determining aircraft susceptibility to departure from controlled flight and to spin entry. The post stall flight regime, inverted pitch hang-up, and limitations assigned in the outline of handbook procedures were examined, along with training and combat maneuvers likely to eventuate in a dangerous flat spin, deployment of the spin recovery parachute, and recovery procedures for post-stall gyrations and spins. R D V

A77-22007 Flight testing the fighter CCV R C Ettinger (USAF, Flight Test Center, Edwards AFB, Calif) and D Thigpen (General Dynamics Corp , St Louis, Mo) (*Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif , Sept 22-25, 1976*) *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 60-78

Progress in the flight testing program for the modified YF-16 control configured vehicle (CCV) fighter aircraft is outlined. Advantages to be derived from the CCV concept include increased load factor without increasing angle of attack, fuselage pointing for weapon aiming, possibly in an integrated fire/flight control system, turning without banking, translation sideways at constant velocity to compensate for crosswinds during air to-ground weapons deliveries, automatic gust alleviation, blended maneuver enhancement, and altering velocity in air combat without broadcasting the plane of motion. Six pilot-commanded control modes and an automatic control mode are described. The tactical value of the flat turn mode, direct lift mode, and fuselage aiming modes is highlighted. R D V

A77-22008 Progress report on the Viggen with emphasis on man-machine design U Frieberg (Saab-Scania AB, Linköping, Sweden) (*Society of Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif , Sept 22-25, 1976*) *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 79-92

Radar displays, automatic controls for air combat maneuvers, audible warnings for pilots, and differences in variants of the Viggen design are discussed. Automatic controls and alarm annunciations are provided for missions involving terrain following or steep dives to low altitude, audibly distinct tone warnings for stall hazard or ground proximity are used. The R8MA engine can be refueled with the engine running. Advantages of the 30 mm Oerlikon armament (projectile weight, effective range, impact energy) are detailed. The on-board radar offers full Doppler look-down capability for detecting hostile aircraft flying at minimum altitude some distance off. Cockpit displays and radar operation are discussed at some length. R D V

A77-22009 Development of a small high-aspect-ratio canard aircraft B Rutan (Rutan Aircraft Factory) (*Society of*

Experimental Test Pilots, Symposium, 20th, Beverly Hills, Calif , Sept 22-25, 1976) *Society of Experimental Test Pilots, Technical Review*, vol 13, no 2, 1976, p 93-101

A canard configuration light aircraft for the homebuilders' and sport aircraft designers' market is described. The design, controls, and aerodynamic performance of the canard foreplane and vertical winglets are explained. Elevators on the canard double as landing flaps. The canard is designed to prevent entry into natural stall. Roll and pitch control systems are combined into elevons on the canard wing, while the main (rear) wing has no control surfaces or flaps. Angle-of-attack limiting design of the two-seater VariEze aircraft is discussed. Special features of amateur aircraft design practice are highlighted. R D V

A77-22045 A theoretical investigation of laminar wakes behind airfoils and the resulting noise pattern A Fathy, M I Rashed (Cairo, University, Cairo, Egypt), and E Lumsdaine (Tennessee, University, Knoxville, Tenn) *Journal of Sound and Vibration*, vol 50, Jan 8, 1977, p 133-144. 10 refs. NSF Grant No OIP-74-21450

A theoretical investigation of the wake pattern downstream of airfoils under predominantly laminar flow conditions and the resultant noise generation is presented. Under these conditions the wake is dominated by a Karman vortex street. A method is developed to theoretically predict the vortex shedding frequency by relating the wake pattern to the airfoil boundary layer parameters through the momentum equation. The generated noise is found to be dominated by a pure tone at the vortex shedding frequency. The results obtained with the present approach were found to agree quite well with experimental results obtained by other investigators. (Author)

A77-22116 # Operational problems of supersonic aircraft (Betriebsprobleme von Überschallverkehrsflugzeugen) P Bork (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 251-261, 265. 18 refs. In German

A description is presented of a number of problems which are connected with the conduction of supersonic flight operations. The flight profile of the Tu-144 is examined, taking into account aspects of fuel consumption and the effect of the atmospheric temperature on the permissible aircraft speed. Attention is also given to questions of suitable flight altitude, the importance of meteorological considerations, the required fuel reserve, aspects of flight preparation, the system of navigation, problems of flight safety, requirements concerning the fuel and the material used in aircraft construction, aircraft operational life considerations, the economy of supersonic aircraft operations, questions of airport adaptation to supersonic traffic, maintenance, radiation hazards, and environmental protection issues. G R

A77-22117 # Winter-related service operations on airports (Winterdienst auf Verkehrsflughafen) H Gruner (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 262-265. In German

Approaches used to maintain airport operations during the winter are discussed. The procedures employed to remove snow and ice from the critical areas of the airport include mechanical, chemical, and thermal methods. A description is presented of various techniques and the design of the employed equipment. Attention is given to the use of methanol, urea, and equipment for melting the ice by means of a hot air jet. G R

A77-22118 # Experience with the VOR navigation system in the German Democratic Republic II (Erfahrungen mit dem VOR-

Navigationssystem in der DDR II. W Trempler and H Richter (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 266-282 In German

Questions related to the decision to install in the Friedland area of the German Democratic Republic an additional VOR unit for an improvement of VOR navigation conditions are discussed. Technical variants in connection with the selection of VOR ground installations are considered and problems related to the location selection process are examined. Attention is given to a consideration of geographical environmental effects on VOR operation, requirements concerning antenna position and antenna design, questions of radiation distribution, economic considerations, and aspects of installation location testing with a mobile VOR unit. G R

A77-22119 # The employment of aircraft on operational areas in the case of differing surface conditions (Der Einsatz von Flugzeugen auf Betriebsflächen bei unterschiedlichen Oberflächenbedingungen) B Glockner (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 283-289 In German

The surface conditions of runways and taxiways have a pronounced effect on the braking characteristics. Information regarding the physical relations involved can provide the basis for an optimal utilization of the various means available for retarding or stopping the aircraft. The principles of operation and the efficiency of the aircraft brake mechanism are investigated, taking into account the coefficient of friction and wheel slippage effects. Questions concerning the occurrence and the effects of lateral forces are examined. Physical processes related to aquaplaning effects are also studied. G R

A77-22120 # The technical concept of the IL-62M II - Fuel system (Die technische Konzeption der IL-62M II - Brennstoffanlage) A Leshchnev, D Borisov, and A Sidorov (*Grazhdanskaya Aviatsiya*, 1976, p 22, 23) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 290-293 In German (Translation)

The IL-62M aircraft has a greater payload and a longer range than the IL-62. The increase in range was obtained with the aid of a number of technical improvements related to the aerodynamic characteristics of the aircraft and the installation of engines with a smaller fuel consumption. An additional fuel tank with a capacity of 5,000 liters was also provided. The design of the fuel system of the IL-62 is described together with the operational principles. Attention is also given to a device for determining the fuel reserve of the aircraft by means of a capacitance method. G R

A77-22121 # The propulsion system of the aircraft Z-37 I (Die Antriebsanlage des Flugzeugs Z-37 I) E Schesky (Dresden, Hochschule für Verkehrswesen, Dresden, East Germany) *Technisch-ökonomische Information der zivilen Luftfahrt*, no 5, 1976, p 297-304 In German

The propulsion system of the aircraft Z-37 consists of the propeller V-520, the engine M-462-RF, and a number of control and regulation systems. The thrust provided by the propulsion system is determined by a number of parameters, which are affected to a large extent by maintenance factors and the pilot. Objective, design, and principles of operation of the propulsion system are discussed and a description is given of characteristic technical-economical parameter values for a comparison of the considered system with other aircraft propulsion systems. G R

A77-22145 Advanced composites manufacturing as influenced by design. A L Mills (USAF, Materials Laboratory, Wright Patterson AFB, Ohio) and C Tanis (Vought Corp., Dallas, Tex.)

SAMPE Quarterly, vol 8, Jan 1977, p 22-29 Contract No F33615-73-C-5066

An advanced composite outer wing panel for the A-7D aircraft has been designed, fabricated and tested. The objective of the program was to develop a flight qualified, all composite structure compatible with design constraints and restrictions caused by form, fit, and function requirements of the existing metal wing assembly. These requirements were coupled with a philosophy of minimum risk to permit in-service evaluation of the wings with unrestricted flight. During the detail design phase a number of design requirements were encountered which were unforeseen during the conceptual design. These requirements influenced the manufacturing approach, the projected manhour costs, and the anticipated weight savings. A summary of these requirements and their effect will be presented. (Author)

A77-22146 Teflon airframe bearings - Their advantages and limitations. F J Williams (Rockwell International Corp., Los Angeles, Calif.) *SAMPE Quarterly*, vol 8, Jan 1977, p 30-37

The military services along with the suppliers and users have established the term 'TFE liner' to describe the type of bonded liner used extensively in Teflon-lined bearings for airframe applications. The paper presents a description of various types of TFE liners and an analysis of their advantages and limitations. The composition and construction of TFE liners varies considerably from firm to firm, but in all of today's liners Teflon is incorporated in some manner as the common component. TFE liners range from 0.009 to 0.018 inch in thickness. It is shown that the high load capacities and low wear rates of TFE liners are primarily the result of the fabric and/or the resin system used. The unique advantages of TFE-lined bearings are that they require no maintenance during their useful life, that they have no corrosion problems as do many of the bonded solid film lubricants, that they accept edge loading, and that they have a reasonably predictable life. Limitations of TFE lined bearings are discussed in terms of wear life due to operating and environmental conditions, contamination from fluids, and installation damage. S D

A77-22166 Development of materials used in gas turbine engines - R and D guide lines and proposals for a priority scheme. P Esslinger and H Huff (Motoren- und Turbinen-Union München GmbH, Munich, West Germany) (*Zeitschrift für Werkstofftechnik*, vol 7, May 1976, p 167-177) *Revue Internationale des Hautes Températures et des Refractaires*, vol 13, no 3, 1976, p 172-180 Translation

Materials development programs for engines, specifically gas turbine engines, and their basic aims are reviewed, and a hierarchy of priorities for planning such programs is devised. Relevant topics are categorized and possible future engine design developments are treated, with emphasis on cooling technology for turbine blading, studies of fracture surfaces, testing of cracks, and casting problems. Priority schemes for budget allotment and for research and development time are worked out for current and future-oriented plans, with attention given to general development targets, high gas temperatures, reduced weight, cost cutting, enhanced reliability, longer service life, and elimination of weak spots. A priority-assigning formula incorporating level of technical progress, probability of success, and urgency is derived. R D V

A77-22181 Gas turbine emission control - A systems approach. A J Teller (Teller Environmental Systems, Inc., Worcester, Mass.) *Air Pollution Control Association, Journal*, vol 27, Feb 1977, p 148, 149 11 refs

Stationary turbine engines in peak power installations or jet engine cells are known to produce particulate emissions, noise, and NO_x. The paper outlines the design and performance capabilities of a nucleator system developed for opacity, particulate, and noise

reduction The device has been operating for the past three years in a jet engine test cell with 17,000 lb thrust engine use The overall nucleator system consists of a boundary flow augments that reduces flow by 30-40% compared with conventional augmenters, a jet peripheral quench system, a nuclear collector mounted on the periphery of the exhaust stack so that no ducting is required, and a cooling tower and solids recovery system for total water loop operation Because of earlier peripheral quenching, there is no explosive hazard The nucleator system provided reduction of opacity from turbine operation to less than 10% Particulate emissions were reduced to the order of 0.003 gr/scf Sound levels were reduced on the order of 50% The installed cost for a single jet engine test cell for a 17,000 lb thrust engine was about \$600,000

A77-22205 # A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations O A Kandil, D T Mook (Virginia Polytechnic Institute and State University, Blacksburg, Va), and A H Nayfeh *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-1* 8 p 20 refs Grant No DAAG29 76-G-0034

A nonlinear vortex-lattice method is developed to compute the distributed and total-load coefficients on different models of canard-wing configurations in steady, low subsonic inviscid flows Several techniques are presented to ensure rapid convergence of the force-free wakes These include addition of an artificial viscosity to the vortex lines and/or utilization of the vortex-core concept Examples include delta and delta-like configurations with a variety of relative angles of attack, relative positions and relative areas Force free wake configurations, pressure distributions and total-load coefficients are presented These results agree closely with the experimental data Extension to long coupled canard-wing configurations is also included (Author)

A77-22206 * # On aerodynamic coupling between lateral and longitudinal degrees of freedom K J Orlik-Ruckemann (National Aeronautical Establishment, Unsteady Aerodynamics Laboratory, Ottawa, Canada) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-4* 13 p 6 refs Contract No NASw-2780

An oscillatory technique for routine measurement of all the direct, cross and cross-coupling moment derivatives due to pitching and yawing has been developed and a series of comprehensive results at Mach numbers 0.7 and 0.25 and at angles of attack up to 40 deg has been obtained in a large wind tunnel It was found that some of the dynamic cross coupling derivatives, that at low angles of attack were all zero, at higher angles of attack could reach values that rendered the pertinent cross-coupling terms in the equations of motion comparable in magnitude to the well-established damping terms Large nonlinear variations with angle of attack were observed in many of the measured derivatives including the important damping-in-pitch and damping-in-yaw derivatives It was concluded that it may be desirable to include some dynamic cross-coupling derivatives, and the functional variation with angle of attack of many derivatives, in the equations of motion, and to consider all these equations simultaneously, rather than in separate longitudinal and lateral groups (Author)

A77-22207 # The transmission of acoustic plane-waves at a jet exhaust R H Schlenger (United Technologies Research Center, East Hartford, Conn) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-22* 14 p 16 refs Research sponsored by the United Technologies Corp

Prediction of core engine noise levels in the far field of a power plant installation requires an understanding of the transmission coefficient for the internal acoustic waves incident at the jet exhaust The present experimental study, conducted at model scale, addresses this question for an acoustic plane wave Higher order acoustic modes were not considered since, in typical engines, these modes are usually cut-off, and therefore attenuated before reaching the nozzle exit The study covered a range of subsonic jet velocities corresponding to Mach numbers of 0, 24, 43, and 70 Results show that the plane-wave mode component of core engine noise is transmitted at the jet exhaust with minimal attenuation over the Mach number range relevant to engine operating conditions (Author)

A77-22215 * # Jet noise source modification due to forward flight R S Larson, C J McColgan, and A B Packman (United Technologies Corp, Pratt and Whitney Aircraft Group, East Hartford, Conn) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-58* 9 p 13 refs Contract No NAS3-17866

The effects of forward flight on the turbulence characteristics of a jet in a co-flowing stream have been determined for a 2.22 inch circular jet in a 36 inch free jet wind tunnel The nozzle exit velocity was 400 ft/sec, and the tunnel velocity was set at 0, 40, 120 and 200 ft/sec Measurements of flow properties including mean velocity, turbulence intensity and spectra, convection velocity, integral length scale, and convected integral time scale were carried out using two linearized hot wires Results were used to predict changes due to flight in the jet acoustic sources The noise reductions for a cold jet with a velocity of 1000 ft/sec, due to the change in acoustic sources in flight, agreed well at all angles with measured noise reductions (Author)

A77-22221 * # Wind tunnel test and calibration techniques for the measurement of damping and dynamic cross derivatives due to pitching and yawing E S Hanff and K J Orlik Ruckemann (National Aeronautical Establishment, Ottawa, Canada) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-80* 12 p 6 refs Contract No NASw 2780

The paper shows how the oscillatory apparatus described previously by Orlik-Ruckemann et al (1974) for determining cross and cross-coupling moment derivatives due to pitching and yawing oscillation is strengthened, extensively modified, and adapted to permit operation in a large continuous-flow wind tunnel Particular attention is given to an electromagnetic three-degrees-of-freedom calibrating system developed to verify the validity of the experimental method and the various aspects of data reduction procedure Typical results from calibration tests and from a series of wind tunnel experiments are presented The only significant limitation is that the apparatus can only be used for models that are relatively small and have a conically shaped longitudinal cavity S D

A77-22227 # Nacelle installation analysis for subsonic transport aircraft W B Gillette (Boeing Commercial Airplane Co., Seattle, Wash) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif , Jan 24-26, 1977, Paper 77-102* 8 p 5 refs

Techniques for the use of subsonic panel aerodynamics methods for nacelle integration on transport type aircraft have been developed and validated against experimental data These techniques are described first for the isolated powered nacelle in both interference-free and high interference conditions The underwing pylon mounted nacelle is then described in detail with emphasis on the three-dimensionality of the flow field and on the need for proper representation of the powered nacelle's exhaust plume The overwing upper surface blowing and pylon-mounted nacelles are also discussed, with emphasis on the use of analysis in the design process (Author)

A77-22228 # Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds J R Howe (General Electric Co., Philadelphia, Pa.) and A L Laganelli *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-113* 16 p 18 refs Contract No F33615-75-C 3065

Acoustic pressure fluctuation data have been acquired at AEDC on a 7.0 degree half cone-angle model, utilizing both sharp and blunt nosetips. Measurements were obtained at Mach 4 and 8 for several values of freestream Reynolds number and model angle of attack, with and without mass injection for the blunt configuration. Stationary zones of laminar, transitional, and turbulent flow over the model were achieved. Resulting power-and-cross-power spectral densities as well as root-mean-square fluctuating pressure data are compared to previous high speed measurements, as a means of defining aeroacoustic environments appropriate for application to re-entry vibration response analyses (Author)

A77 22030 Brewster angle for an E-polarized electromagnetic wave interacting with a moving dielectric medium P K Mukherjee (Delhi, University, Delhi, India) *Journal of Applied Physics*, vol 48, Feb 1977, p 592-595 8 refs Research supported by the Department of Atomic Energy of India

The Brewster angle phenomenon of total transmission has been investigated with reference to an E polarized electromagnetic wave interacting with a dielectric half space moving along the interface. Analytical conditions are derived for the existence of Brewster angles. It is shown how the Brewster angles are modified by replacing the incident region (in which the incident electromagnetic wave is propagated) with an isotropic or a uniaxially anisotropic plasma. The Brewster angles are found to behave in a remarkably different fashion under various conditions. Numerical results for the Brewster angles, showing their dependence on the nondimensional velocity of the medium, are presented for several values of the physical parameters (Author)

A77-22231 # Boundary layer transition flight test observations A M Berkowitz, C L Kyriakos, and A Martellucci (General Electric Co., Philadelphia, Pa.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-125* 42 p 36 refs Contract No F33615-76-C-3010

A historical review regarding the evolution of flight test boundary layer transition correlations in connection with the development of operational ballistic reentry vehicles in the US is presented, taking into account the time periods from 1956 to 1961, from 1961 to 1971, and from 1971 to the present time. Questions of transition data evaluation are discussed, taking into account transition data selection criteria, angle of attack effects, vehicle geometry characteristics, on-board sensors, redundant transition altitude sensors, vehicle classifications, and aspects of local flow property determination. A correlation evaluation is also conducted, giving attention to the ground test, the flight test, wall cooling effects, nose related parameters, and bluntness correlations G R

A77-22234 # The turbulent wake behind slender propeller driven bodies at angle of attack J A Schetz, E B Daffan, and A K Jakubowski (Virginia Polytechnic Institute and State University, Blacksburg, Va.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-133* 11 p 7 refs ARPA-supported research

Three effects on turbulent wakes behind propeller-driven bodies are examined in detail. The first is the effect of pitch angle. The second is the addition of an appendage such as a submarine 'sail' to an axisymmetric body. The third is the replacement of a single propeller by an equivalent set of side-by-side counterrotating

propellers. Testing was conducted in a six-foot wind tunnel at a Reynolds number of 440,000, based on the model diameter. Measurements of total pressure, static pressure, flow angularity, axial turbulence, radial turbulence, and radial shear stress were made at discrete points across the wake at three downstream stations. These measurements yielded the velocity components, axial turbulence intensity, radial turbulence intensity, and radial shear stress through the wake. The measurements were taken using a yawhead pressure probe, a standard pitot-static probe, and an x-hot-wire probe (Author)

A77-22235 # Application of boundary layer blowing to suppress strong shock induced separation in supersonic inlets W F Wong (Northrop Corp., Hawthorne, Calif.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-147* 10 p

An experimental study was conducted to investigate the application of boundary layer blowing to suppress strong shock-induced separation in supersonic inlets. A tangential blowing system consisting of a single row of aft-facing discrete jets was tested on an isolated external compression inlet model at a free-stream Mach number of 2 and a unit Reynolds number of 10 million. The blowing boundary-layer-control concept was shown to control successfully strong shock-induced separation with terminal shock strength approaching Mach 2. The single blowing location was able to provide control over a wide range of mass-flow ratio. Results obtained with cold flow showed near-ideal inlet performance was achieved with an excess blowing momentum coefficient of 1.5-2.0 for terminal shock strength in the range from Mach 1.6 to about 2. Increasing the jet spacing and/or blowing temperature resulted in a decrease in control effectiveness for terminal shock locations near the blowing exit (low mass-flow ratio). The loss in effectiveness is apparently related to reduced mixing of the blowing jets and the incoming boundary layer for these two conditions (Author)

A77 22238 * # Nonlinear, unsteady aerodynamic loads on rectangular and delta wings E H Atta, O A Kandil, D T Mook, and A H Nayfeh (Virginia Polytechnic Institute and State University, Blacksburg, Va.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-156* 8 p 16 refs Grant No NGR-47 004-090

Nonlinear unsteady aerodynamic loads on rectangular and delta wings in an incompressible flow are calculated by using an unsteady vortex-lattice model. Examples include flows past fixed wings in unsteady uniform streams and flows past wings undergoing unsteady motions. The unsteadiness may be due to gusty winds or pitching oscillations. The present technique establishes a reliable approach which can be utilized in the analysis of problems associated with the dynamics and aeroelasticity of wings within a wide range of angles of attack (Author)

A77 22239 # Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer J E Yates (Aeronautical Research Associates of Princeton, Inc., Princeton, N.J.) *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan 24-26, 1977, Paper 77-157* 37 p 13 refs Contracts No F44620-75-C-0010, No N00014-76-C-0576

The paper investigates the problem of a semi-infinite airfoil

oscillating in an idealized two-step potential flow model of a parallel shear flow. Two trailing edge boundary conditions are considered: the Kutta condition, and a zero vortex shedding or no Kutta condition. The solution is valid for small shear layer velocity defect, and numerical results have been obtained for arbitrary reduced frequency and shear layer thickness. It is found that in steady flow, the trailing edge pressure is uniformly attenuated by the shear layer. The unsteady pressure amplitude is attenuated and the phase of the pressure is significantly changed by the shear layer. Compressibility has a significant effect on the form of the pressure distribution as the acoustic wave number becomes comparable to the reciprocal flap length. B J

A77-22240 * # A subsonic flow investigation on a research body at high angles of attack. M. H. Clarkson (NASA, Ames Research Center, Moffett Field, Calif., Florida, University, Gainesville, Fla.), G. N. Malcolm, and G. T. Chapman (NASA, Ames Research Center, Aerodynamic Research Branch, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan. 24-26, 1977, Paper 77-180*. 13 p. 17 refs.

Tests conducted in the Ames 12 foot pressure wind tunnel on a rotating research body at angles of attack of 45 to 90 deg yielded results that were inconsistent with simple cross flow theory. Consequently, force and pressure distribution tests along with oil and sublimation flow-visualization studies were conducted in the same tunnel on a nonrotating model to attempt to explain the behavior observed in the rotary tests. These studies indicate that at appropriate conditions of Reynolds number and angle of attack, inflectional instabilities occur in the boundary layer that materially affect separation and, hence, the aerodynamic forces. Calculations of cross-flow Reynolds numbers are made and compared with other works on inflectional instability. (Author)

A77-22244 * # Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings. W. Kordulla (NASA, Ames Research Center, Moffett Field, Calif.). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan. 24-26, 1977, Paper 77-209*. 14 p. 48 refs.

Inviscid small-disturbance theory has been shown to predict three-dimensional transonic flows about finite wings reasonably well as long as viscous effects are negligible. In order to include these effects, the inviscid small-disturbance solution of Bailey and Balhaus (1975) has been combined with a finite-difference solution for Prandtl's boundary-layer equations. This solution employs the conditionally stable Krause (1968) scheme, implicit in the direction normal to the wall, to cope with the domain-of-dependence problem that arises for reverse cross flow. To be consistent with the inviscid-flow solution, the boundary layer is computed in the representative wing planform plane which is transformed into rectangular shape in the computational domain. The flow has been assumed turbulent, and a scalar eddy-viscosity model is adopted. The interaction between inviscid and viscous flow is modeled with the help of the displacement surface which is added to the geometric wing shape. Sample distributions of displacement thickness for swept wings are presented for weak and strong interaction cases. (Author)

A77-22248 # Prediction of pressure distributions on axisymmetric bodies in transonic flow. S. F. Yaros (ARO, Inc., Arnold Air Force Station, Tenn.). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 15th, Los Angeles, Calif., Jan. 24-26, 1977, Paper 77-226*. 10 p. 15 refs.

A numerical investigation is reported of pressure-distribution predictions on arbitrary bodies of revolution in transonic flow, including both boundary-layer displacement and exhaust-plume entrainment effects. The approach taken is a viscous/inviscid iterative one involving an integral boundary-layer program and an inviscid

transonic program. For attached boundary layers, the calculation procedure has been fully automated for both subcritical and supercritical cases, and predicted pressure distributions agree well with experimental data. The entrainment effect of a real plume was modeled using mass-conservation considerations to determine an effective plume displacement thickness. (Author)

A77-22260 Vibration tests on aircraft engines. D. S. Elenevskii, R. S. Bekbulatov, L. M. Mel'nikov, B. A. Rogozhkin, and I. G. Sipukhin. (*Problemy Prochnosti*, May 1976, p. 37-40.) *Strength of Materials*, vol. 8, no. 5, Feb. 1977, p. 541-544. Translation.

The paper examines methodological problems regarding full-scale vibration testing of engines and their different sections on electrodynamic rigs under predetermined and random excitation. A complex of full scale vibration tests is described, including power unit, automatic systems for programmed control of excitation, data acquisition systems, and systems for analog and digital processing of test results. The complex has been in service for several years and yielded good results in testing aircraft engines. S D

A77-22266 Fatigue of gas-turbine blades made of heat-resistant casting alloys. B. F. Balashov, A. N. Petukhov, A. N. Arkhipov, and B. V. Volodenko. (*Problemy Prochnosti*, May 1976, p. 65-73.) *Strength of Materials*, vol. 8, no. 5, Feb. 1977, p. 570-578. 10 refs. Translation.

Fatigue test results are presented for profile and root sections of gas turbine blades made from cast nickel alloys ZhS6K, ZhS6U, and VZhL12U at normal and elevated temperatures. Particular attention is given to the effect of structural and technological factors on the fatigue of the blades. It is shown that the fatigue of the profile and locking connections of cast blades increases with increasing test temperature. Fatigue strength is greatly affected by the scale factor, where the endurance limit is decreased with an increase in dimensions. Asymmetry of loading cycle and stress concentration have a lesser effect. Statistical characteristics pertaining to the distribution of the endurance limits of blade attachments are presented. S D

A77-22449 # The principles of aerodynamics (Osnovy aerodinamiki). L. Kh. Kokunina. Moscow, Izdatel'stvo Transport, 1976. 208 p. In Russian.

This textbook discusses the fundamentals of aerodynamics with attention given to the basic notions and laws of aerodynamics, aerodynamic forces, aerodynamic characteristics of the wing and the aircraft, and the basics of high-speed aerodynamics. Also considered are propeller dynamics, flight dynamics (steady and unsteady aircraft motion), the equilibrium, stability, and controllability of aircraft, and the fundamentals of the aerodynamics of helicopters and rockets. B J

A77-22450 # Practical aerodynamics of the Yak-18T airplane (Prakticheskaia aerodinamika samoleta Iak-18T). K. N. Laletin, G. T. Ganus, Iu. P. Ivanov, L. M. Nikolaev, and V. G. Russakov. Moscow, Izdatel'stvo Transport, 1976. 216 p. In Russian.

Some aspects of the general low-speed aerodynamics and the practical aerodynamics of the Yak-18T trainer are examined, along with its balancing, stability, and steady and unsteady flight characteristics. Particular attention is given to flight operations, the characteristics of piloting the plane (including acrobatics), and to the interpretation of the physical process that occur during the various flight conditions. Some emergency situations (icing, forced landing, engine or control system malfunctions, etc.) are examined, and appropriate pilot actions are outlined. V P

A77-22541 # Inspection of the working order of airplanes and helicopters Handbook (Kontrol' tekhnicheskoi ispravnosti samoletov i vertoletov Spravochnik) V G Aleksandrov, Iu A Glazkov, A G Aleksandrov, and P N Sidorkin Moscow, Izdatel'stvo Transport, 1976 360 p In Russian

The handbook deals with modern inspection methods used in civil aviation. It covers such topics as types of inspection, technical specifications of airworthiness, repair, and maintenance norms, techniques for detecting malfunctions of technological systems, subsystems, and elements, methods of inspecting feed lines, manifolds, joints of various type, fuel contamination, etc., optimal methods of inspecting fuselages, gas turbines, and their elements. Much attention is given to modern optical material testing (flaw detection) and inspection methods. V P

A77-22662 A wing for the Airbus D H Dykins (Hawker Siddeley Aviation, Ltd, Hatfield, Herts, England) *Physics in Technology*, vol 7, Nov 1976, p 246-253

The process and some of the problems in the design of the A-300 wing for the Airbus are described. Attention is given to the effects of Reynolds number and the wind tunnel program partly developed to test Reynolds number effects. High speed tests were performed at a Reynolds number of 6×10^6 to the 6th and involved the following model types: unswept wing, sectional two-dimensional model with pressure plotting, half model of wing and fuselage, and complete model of wing plus fuselage and tail unit. The objectives of the low speed program were a high stalling lift coefficient and a high efficiency (lift/drag) at incidences just below the stall. Low speed tests were performed on the following model types: swept parallel-chord half model, complete model, half model, and swept parallel-chord half model. B J

A77-22668 Maximum rotor thrust capabilities, articulated and teetering rotors K B Amer and S V LaForge (Hughes Helicopters, Culver City, Calif) *American Helicopter Society, Journal*, vol 22, Jan 1977, p 11, 12 7 refs

Evidence that a two-blade teetering rotor can attain a higher rotor thrust limit than an articulated rotor can is claimed. Effects of power level during a pullup, rpm increase during the pullup, and reduction of forward speed during the pullup are accounted for. These effects are considered crucial parameters for determining blade stall limits. The maximum thrust capabilities of teetering and articulated rotors are shown to be equal when these effects are taken into account. R D V

A77-22669 Advancing blade concept (ABC) development A J Ruddell (United Technologies Corp, Sikorsky Aircraft Div, Stratford, Conn) (*American Helicopter Society, Annual National Forum, 32nd, Washington, D C, May 1976*) *American Helicopter Society, Journal*, vol 22, Jan 1977, p 13-23 5 refs

A brief review of the principles and development of the Advancing Blade Concept is presented. Aircraft and control system configurations are defined. Load sharing between rotors and the distribution of lift on the advancing and retreating blades can be adjusted in flight. The coaxial rotor system is providing significantly better hover performance than a single rotor, with low noise levels. A summary of pertinent rotor loads and stresses and their relationship to blade tip clearance is presented. Variations of differential cyclic pitch between rotors effectively moves the center of lift of each rotor. (Author)

A77 22670 A prescribed wake lifting surface hover performance analysis J D Kocurek and J L Tangler (Bell Helicopter

Textron, Fort Worth, Tex) (*American Helicopter Society, Annual National Forum, 32nd, Washington, D C, May 1976*) *American Helicopter Society, Journal*, vol 22, Jan 1977, p 24-35 11 refs

The application of lifting surface theory to the calculation of rotor hover performance, and the development of an improved prescribed wake representation resulting from schlieren flow visualization studies of model rotor wakes are described. Qualitative comparisons between lifting line and lifting surface methods show the tendency of the lifting line to react excessively when a vortex passes close to a blade. The flow visualization studies reveal wake sensitivity to thrust coefficient, number of blades, and twist not identified in previous investigations. The need to include a recirculation mechanism in the analytical model to provide inflow in addition to that available from the prescribed wake structure is established. A possible source of the recirculation is demonstrated to be the result of vortex interaction and wake expansion immediately below the well-defined near wake. (Author)

A77-22678 * # Vortex interactions and decay in aircraft wakes A J Bilanin, M E Teske, and G G Williamson (Aeronautical Research Associates of Princeton, Inc, Princeton, N J) *AIAA Journal*, vol 15, Feb 1977, p 250-260 37 refs Contracts No NAS1 13932, No F33615-73-C-3138

The dynamic interactions of aircraft wake vortices are investigated using both inviscid and viscous models. The phenomenon of vortex merging resulting in the rapid aging of a vortex wake is examined in detail. It is shown that the redistribution of vorticity from convection and diffusion during merging is a mechanism effective in reducing the hazard of a wake. Inviscid computations show that the merging phenomenon may be sensitive to small changes in spanwise load distribution and that the fuselage vortex shed from the wing-fuselage junction can play a significant role in promoting merging of wing-tip and flap vortices. Vortex wake-merging computations using a second-order closure model of turbulent transport indicate that a low-hazard wake occurs when the generating aircraft flap and wing-tip vortices of the same strength and sign. This optimum is achieved when the flap vortex is located outboard approximately 40% of the distance to the tip vortex. (Author)

A77-22679 # On the not-so-slender wing theory D D Liu (Northrop Corp, Hawthorne, Calif) *AIAA Journal*, vol 15, Feb 1977, p 261-263 14 refs

A simple method for obtaining the body potentials of a 'not-so-slender' wing and their antisymmetric (lifting) potentials directly in the physical plane is presented which is based on an uncovered asymptotic property of a line-source structure near the body axis, with the slender-body solution being the lowest-order term. It is shown that the subsequent higher-order terms involve no newer functional relation than that already found in the slender-body solution. General recurrence formulas are derived for the particular not-so-slender body potentials in the linearized field of subsonic, supersonic, and sonic flows. Analytical near-field sonic-flow solutions are obtained for the configuration of slender pointed wings. F G M

A77-22685 * # Derivation of an integral equation for transonic flows W Ogana (NASA, Ames Research Center, Moffett Field, Calif) and J R Spreiter (Stanford University, Stanford, Calif) *AIAA Journal*, vol 15, Feb 1977, p 281-283 10 refs

It is noted that the nonlinear partial differential equation for the perturbation velocity potential and boundary conditions describing steady inviscid compressible transonic flow past a thin two-dimensional airfoil can be transformed into a singular integro-differential equation and that differentiation of the latter yields an

integral equation Two forms of this integral equation currently exist one for the singularity that is enclosed in an infinitely long strip of vanishing thickness and the other for the singularity that is enclosed in a vanishing circle In the present article, a more general integral equation is derived by enclosing the singularity in a vanishing rectangular cavity of arbitrary aspect ratio The two existing forms of this equation are deduced as special cases distinguished by the respective values for the aspect ratio (infinity for the first form and unity for the second) F G M

A77-22708 # System identification for nonlinear aerodynamic flight regimes W E Hall, Jr and N K Gupta (Systems Control, Inc., Palo Alto, Calif) *Journal of Spacecraft and Rockets*, vol 14, Feb 1977, p 73-80 26 refs Contract No N00014-72-C-0328

A development for the identification of aerodynamic forces and moments in nonlinear regimes is presented, with applications to simulated and flight test response data This development is a two-step method The first step is the application of an algorithm which determines the order and coefficients of polynomial expansions of the nonlinear aerodynamic forces and moments which characterize the nonlinear flight regime The second step is the use of a nonlinear six-degree-of-freedom maximum-likelihood algorithm which accurately estimates the values of the polynomial coefficients This method has been applied to simulated and flight-test data for a twin-engine swept-wing fighter aircraft in stall/poststall aerodynamic regimes (Author)

A77-22728 # Operational requirements for advanced fighter aircrew displays J K Ready (U S Navy, Washington, D C) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 18-39

In the present paper, it is attempted to provide insight into how a Navy fighter pilot thinks in the air and what type of information he needs Some ideas on improving and simplifying the pilot's management of cockpit data are proposed The types of display essential to provide the needed information to a pilot in a simple, accurate, reliable form are examined V P

A77-22729 # Cockpit information requirements - Common elements R J McCusker In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 48-52

The specific information which a pilot needs to conduct a particular mission phase is discussed Improvements are suggested that would permit the pilot to fully utilize the potential of the systems available to him V P

A77-22730 # The maneuvering flight path display J F Watler, Jr (Northrop Corp, Hawthorne, Calif) and G W Hoover In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 215-230

Integrated visual displays are understood to mean displays which present only 'solution' information, i.e., the information which represents the solution to an equation, rather than the parameters or variables involved in the equation The present paper deals with an advanced aircraft display concept of this type, known as the Maneuvering Flight Path Display The basis of the concept, the functions and characteristics of its elements, its projected applications, its information content, and its status of development are discussed, along with the activities planned to establish conclusively its operational feasibility The display will be used in all modes of flight Presently, it is being mechanized for use in air combat maneuvering V P

A77-22733 # Solid state Helmet Mounted Display and Head Position Sensing System J Campbell and I F Cooper (Marconi Elliott Avionics Systems, Ltd, Rochester, Kent, England) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 289-306

The Marconi Elliott Helmet System incorporates a Helmet Mounted Display and a Helmet Optical Position Sensor The system provides a powerful aid for extending the capability of the pilot by designating a ground target, slewing sensors (such as IR, LLTV), and radar, or guiding a missile by simply looking in the desired direction The Helmet Mounted Display, used independently, provides a highly effective system for displaying warnings as well as some types of flight control data In the present paper the system and its elements are discussed V P

A77-22734 # A helmet-mounted light emitting diode /LED/ display applied to the aircraft maneuverability problem W F Moroney and P E Mullenwey (U S Navy, Pacific Missile Test Center, Point Mugu, Calif) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 307-313

The Helmet Mounted Display examined in the present paper uses a light-emitting diode array as the display medium The display will be used to present an energy maneuverability display format similar to that developed by McDonnell Douglas The need for such a display is demonstrated, and the potential uses of the display are outlined V P

A77-22736 # Evaluating the characteristics of luminous colored cockpit displays J Burns (Du Mont Electron Tubes and Devices Corp, Clifton, N J) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 338-349

The theoretical and experimental investigation described was focused on developing displays that satisfy some basic pilot's needs created by evolution in navigation conditions The study has made possible to define a Detection Index that permits easy and rapid evaluation of the efficiency of screen display systems under the luminous environment typical of airplanes in flight An example is given for a tactical situation where color is used as a warning device to an operator engrossed in his workload V P

A77-22737 # Integrated color display system L D Evans (Lockheed California Co, Burbank, Calif) and S Storper (Loral Electronics Systems, Yonkers, N Y) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 350-362

The use of multipurpose displays has enhanced the integration and presentation of multiple sensor information Color enhancement allows immediate perception of validity and provides the potential to increase operator efficiency The need for development of useful symbology through research is indicated V P

A77-22738 # Tactical air applications for advanced multi-sensor imagery processing and display techniques E L Cloud and T A Stinnett (Westinghouse Defense and Electronic Systems Center, Baltimore, Md) In *Advanced Aircrew Display Symposium*, 3rd, Patuxent River, Md, May 19, 20, 1976, Proceedings Patuxent River, Md, U S Naval Air Systems Command, Naval Air Test Center, 1976, p 363-379

The dynamic experimentation described was centered on real-time viewing of integrated multisensor (IR and TV) tactical imagery

both in color and black and white, and on the application of display processing techniques, such as level slicing and surface differentiation. The experiments showed that electronically processed multi-sensor imagery results in a significant reduction in operator response time and increased accuracy for target detection and recognition. It also facilitates the assimilation of additional information content.

A77-22756 # Design of military aircraft for minimum cost of ownership. A. S. Delahunty (British Aircraft Corp., Ltd. Preston, Lancs., England). In: Symposium on Equipment and Systems Design for Minimum Cost of Ownership, London, England, March 16, 1976, Proceedings. London, Royal Aeronautical Society, 1976. 11 p., Discussion, p. C1-C6.

Problems that confront the military aircraft designer as opposed to the civil aircraft designer are identified. The discussion covers reduction of unit design costs, reduction of maintainability costs, reduction of training costs, and aircraft effectivity with respect to kill probability. Unit cost reduction should not be achieved at the expense of increased cost of aircraft maintenance. Design for reduced maintenance and training costs can best be attained by user/designer consultations at a very early stage of design.

A77-22929 # Jet engine nozzles (Sopla reaktivnykh dvigatelei). D. A. Mel'nikov, U. G. Pirumov, and A. A. Sergienko. In: Aeromechanics and gas dynamics. Moscow, Izdatel'stvo Nauka, 1976, p. 57-75. 13 refs. In Russian.

The results of theoretical and experimental studies of gas flows in jet engine nozzles are summarized. The flow characteristics in the subsonic, transonic, and supersonic sections of such nozzles are briefly discussed. Methods of designing the sections of an optimal nozzle are described, along with theoretical and experimental methods of determining the principal components of thrust losses. The results presented are used to develop a method of profiling optimal jet engine nozzles.

A77-22934 # Calculation of supersonic laminar flow about a blunt body and the flow in the wake (Raschet sverkhzvukovogo laminarnogo obtekanii zatuplennogo tela i techeniia v slede). N. S. Kokoshinskaya, B. M. Pavlov, and V. M. Paskonov. In: Aeromechanics and gas dynamics. Moscow, Izdatel'stvo Nauka, 1976, p. 160-171. 25 refs. In Russian.

A finite-difference technique for solving the complete unsteady-state system of Navier-Stokes equations is used to study the structure of viscous-gas flows about axisymmetric blunt bodies of finite size and the flows in their wakes. The problem considered is that of an equilibrium supersonic flow of viscous gas about a blunt axisymmetric conic section at zero angle of attack and Reynolds numbers ranging from 200 to 10,000. A steady-state solution in the flow region perturbed by the body is obtained by the cited technique, and methods are outlined for obtaining a numerical solution in a greatly extended region of space containing shock waves, boundary layers, reverse-circulation flows, and wakes. Some numerical results are presented for the flow about a spherically blunt cylinder and a blunt 10-deg conic section. These results show that flow structure in the near and far wakes can be computed only if the effect of the bow shock is taken into account.

A computer program for analyzing inviscid isentropic transonic flow past 3-D swept configurations is presented. Some basic aspects of the program are (1) the free-stream Mach number is restricted only by the isentropic assumption, (2) weak shock waves are automatically located wherever they occur in the flow (3) the finite-difference form of the full equation for the velocity potential is solved by the method of relaxation, after the flow exterior to the airfoil is mapped to the upper half plane (4) the mapping procedure allows exact satisfaction of the boundary conditions and use of supersonic free stream velocities, (5) the finite difference operator is locally rotated in supersonic flow regions so as to properly account for the domain of dependence and (6) the relaxation algorithm was stabilized using criteria from a time-like analogy

Jet exhaust nozzle installation, and model support interference effects on the longitudinal aerodynamic characteristics of a twin-engine fighter model were determined. Realistic jet exhaust nozzle configurations and a reference configuration with a simulated vertical-tail support were tested. Free-stream Mach number was varied from 0.6 to 1.2 and model angle of attack from 0 deg to 9 deg. The jet exhaust affected drag more than it affected lift and pitching moment. The largest effects occurred at a Mach number of 0.9 and for the afterburning mode of exhaust nozzle operation. The combined differences between the aerodynamic characteristics of the realistic and reference configurations (which were due to afterbody and nozzle contours, jet operation, and simulated reference support interference) were considerably different from those for the jet interference alone.

A 1- by 3-meter semispan wing of taper ratio 1.0 with NACA 0012 airfoil section contours was tested in the Langley V/STOL tunnel to measure the pressure distribution at five sweep angles 0 deg 10 deg 20 deg 30 deg and 40 deg, through an angle-of-attack range from -6 deg to 20 deg. The pressure data are presented as plots of pressure coefficients at each static-pressure tap location on the wing. Flow visualization wing-tuft photographs are also presented for a wing of 40 deg sweep. A comparison between theory and experiment using two inviscid theories and a viscous theory shows good agreement for pressure distributions normal forces, and pitching moments for the wing at 0 deg sweep.

An investigation was conducted in the Langley low turbulence pressure tunnel to determine the effects of wing leading edge radius and Reynolds number on the longitudinal aerodynamic characteristics of a series of highly swept wing-body configurations. The tests were conducted at Mach numbers below 0.30, angles of attack up to 16 deg and Reynolds numbers per meter from 6.57 million to 43.27 million. The wings under study in this investigation had leading edge sweep angles of 61.7 deg, 64.61 deg and 67.01 deg in combination with trailing edge sweep angles of 0 deg and 40.6 deg. The leading edge radii of each wing planform could be varied from sharp to nearly round.

AUGMENTATION OF MANEUVER PERFORMANCE BY SPANWISE BLOWING
Gary E Erickson (George Washington Univ) and James F Campbell Jan 1977 239 p refs
(NASA-TM-X-73998) Avail NTIS HC A11/MF A01 CSCI 01A

A generalized wind tunnel model was tested to investigate new component concepts utilizing spanwise blowing to provide improved maneuver characteristics for advanced fighter aircraft. Primary emphasis was placed on high angle of attack performance stability, and control at subsonic speeds. Spanwise blowing on a 44 deg swept trapezoidal wing resulted in leading edge vortex enhancement with subsequent large vortex-induced lift increments and drag polar improvements at the higher angles of attack. Small deflections of a leading edge flap delayed these lift and drag benefits to higher angles of attack. In addition, blowing was more effective at higher Mach numbers. Spanwise blowing in conjunction with a deflected trailing edge flap resulted in lift and drag benefits that exceeded the summation of the effects of each high lift device acting alone. Asymmetric blowing was an effective lateral control device at the higher angles of attack. Spanwise blowing on the wing reduced horizontal tail loading and improved the lateral-directional stability characteristics of a wing-horizontal tail-vertical tail configuration. Author

(NASA-CR-149461) Avail NTIS HC A06/MF A01 CSCI 01A

The interactions between a turbulent flow structure, responding to its excitation were studied. The turbulence was typical of those associated with a boundary layer, having a cross-spectral density indicative of convection and statistical decay. A number of structural models were considered. Among the one-dimensional models were an unsupported infinite beam and a periodically supported infinite beam. The fuselage construction of an aircraft was then considered. For the two-dimensional case a simple membrane was used to illustrate the type of formulation applicable to most two-dimensional structures. Both the one-dimensional and two-dimensional structures studied were backed by a cavity filled with an initially quiescent fluid to simulate the acoustic environment when the structure forms one side of a cabin of a sea vessel or aircraft. (NASA-TM-X-73982) Avail NTIS HC A02/MF A01 CSCI 01A

Wind-tunnel tests have been made in the Langley transonic dynamics tunnel on a 0.25-scale model of Sandia Laboratories 3.96-meter (13-foot), slanted ribbon design lifting parachute. The lifting parachute is the first stage of a proposed two-stage payload delivery system. The lifting parachute model was attached to a forebody representing the payload. The forebody was designed and installed in the test section in a manner which

allowed rotational freedom about the pitch and yaw axes. Values of parachute axial force coefficient, rolling moment coefficient, and payload trim angles in pitch and yaw are presented through the transonic speed range. Data are presented for the parachute in both the reefed and full open conditions. Time history records of lifting parachute deployment and disreefing tests are included. Author

REVIEW OF THE APPLICATION OF HODOGRAPH THEORY TO TRANSONIC AEROFOIL DESIGN AND THEORETICAL AND EXPERIMENTAL ANALYSIS OF SHOCK-FREE AEROFOILS

J W Boerstoeel 10 Jun 1976 27 p refs Presented at the IUTAM Symp Transsonicum II, Goettingen, West Ger, 8-13 Sep 1975. Sponsored by Neth Agency for Aerospace Programs (NLR-MP-75033-U) Avail NTIS HC A03/MF A01

After an introductory sketch of hodograph theory, the mathematical concepts, on which a few modern hodograph methods for computational airfoil design are based, are summarized. The mathematical methods used lead to two different types of computation procedures, these are discussed. Typical computation results of a few advanced airfoils are shown. As far as available, typical experimental results are also presented. An attempt is made to summarize what maximum thickness ratio's of shock-free airfoils can be realized at a given design point according to present-day knowledge. An analysis of the leading edge shape of an interesting type of airfoil shows that the applicability of finite difference methods for the design of such airfoils should be considered a more difficult matter than perhaps is generally appreciated. It is concluded that a computational design method for shock-free airfoils based on hodograph theory is nowadays a valuable tool for transonic airfoil and wing designers. Author (ESA)

REMARKS ON THE SUITABILITY OF VARIOUS TRANSONIC SMALL PERTURBATION EQUATIONS TO DESCRIBE THREE-DIMENSIONAL TRANSONIC FLOW, EXAMPLES OF COMPUTATIONS USING A FULLY-CONSERVATIVE ROTATED DIFFERENCE SCHEME

J VanDerVooren J W Slooff, G H Huizing, and A VanEssen 24 Oct 1975 13 p refs Presented at IUTAM Symp Transsonicum II, Goettingen, West Ger, 8-13 Sep 1975 (NLR-MP-75039-U) Avail NTIS HC A02/MF A01

Different transonic small perturbation equations, currently used for the calculation of transonic flow over wing-fuselage configurations are reviewed. An equation is presented which has this proper mass conservative form. The importance of this property is illustrated by investigating the shock relations of the various equations for three typical shocks, viz normal shocks, strong shocks on an infinite-yawed wing and so-called forward weak shocks downstream of which the flow remains supersonic. These latter shocks are swept back and are part of the three-shock pattern which can occur under certain circumstances on the upper surface of a lifting wing. A fully-conservative rotated difference scheme for transonic small perturbation equations is introduced. Examples of computations illustrate the large influence of this scheme on shock strength and position as compared to a non-conservative scheme. Results for a wing on which a three-shock occurs are also presented. Author (ESA)

Fluid Dynamics Div
ON THE MOTION OF SHOCK WAVES ON AN AIRFOIL WITH OSCILLATING FLAP IN TWO-DIMENSIONAL TRANSONIC FLOW
H. Tijdeman, 14 Mar 1975, 40 p, refs. Sponsored by Neth Agency for Aerospace Programs
(NLR-TR-75038-U) Avail NTIS HC A03/MF A01

Results are presented of measurements of the periodical motion of the shock waves on a NACA 64A006 airfoil with harmonically oscillating trailing-edge flap of 25 % of the chord in two-dimensional attached transonic flow in order to predict unsteady loads on oscillating wing in transonic flow. It is shown that three different types of shock wave motion can be distinguished. An analytical model is developed, with which a satisfactory explanation can be given of the observed three types of shock wave motion. This analytical model includes the effect of streamwise pressure gradients ahead of the shock wave and remains - in contrast with earlier unsteady shock wave models - valid for low frequencies and quasi-steady flow. LAMINAR SEPARATION NEAR THE TRAILING EDGE OF A THIN PROFILE
Rene Schmitt, Dec 1976, 132 p, refs. Transl into ENGLISH of 'Decollement Laminaire au Voisinage du Bord de Fuite d'un Profil Mince', ONERA Paris Report ONERA-NT-1976-3, 1976. Original report in FRENCH previously announced as ESA-98184 (ESA-TT-343, ONERA-NT-1976-3). Avail NTIS HC A07/MF A01

The laminar separation taking place around the wedge-shaped trailing edge of a thin wing placed in an incompressible, two-dimensional flow at very high Reynolds numbers was studied by the method of matched asymptotic developments. In the case where the dihedral effect is more important than the loss of the adherence effect, a three-layer scheme was developed around the separation point. In the lower layer, where viscous effects are predominant, the flow is governed by a universal canonical problem containing only one parameter, related to the separation location. The calculation of the asymptotic behaviors of the solution of the canonical problem, at infinity both upstream and downstream of the viscous sublayer, is mainly dealt with.

LIFTING SURFACE THEORY FOR WINGS OF ARBITRARY PLANFORM M.S. Thesis
John Leroy Parks, Mar 1976, 67 p, refs.
(AD-A028449) Avail NTIS HC A04/MF A01 CSCL 01/1

This theory permits the calculation of pressure distributions over a thin airfoil in steady, inviscid, incompressible flow, or given a desired chordwise pressure distribution the camber line of an ideal wing can be determined. The method treats the circulation about the wing as a continuous vortex sheet of variable strength covering the wing planform and trailing downstream to infinity. The results of the present numerical solution for the pressure distribution solution are not conclusive. However, the solution for the camber line of an ideal wing is in reasonable agreement with published two dimensional results. GRA

EVALUATION OF HALON 1301 SYSTEM FOR POSTCRASH AIRCRAFT INTERNAL CABIN FIRE PROTECTION Final Report, May - Dec 1975
Richard Hill and Paul N. Bons, Oct 1976, 38 p, refs.
(AD-A032150/5, FAA-NA-76-21, FAA-RD-76-132) Avail NTIS HC A03/MF A01 CSCL 01/2

The use of a Halon 1301 fire-suppression system was evaluated in regard to increasing escape time during a ground crash situation with an internal cabin fire. Tests were conducted in a DC7 fuselage varying the exit configurations, and fire size at agent discharge. Smoke temperature, carbon monoxide, oxygen, and Halon 1301 levels were continuously monitored during the tests at various locations throughout the cabin. A sampling system for collecting hydrogen fluoride (Halon 1301's primary decomposition product) was used. Samples at four locations were taken every 30 seconds, for 5 minutes after discharge. The use of a curtain to inhibit the spread of HF was also examined. The results indicated that in order to minimize the HF concentrations, the fire should be extinguished prior to the opening of cabin exits. The use of a curtain to partition the cabin greatly reduced the spread of HF from the fire zone to the protected section. Test results also indicated that a system malfunction causing Halon 1301 concentrations less than those needed to extinguish a fire could produce very high HF levels. Author

Concept design is presented for two types of lift/cruise fan technology V/STOL aircraft: turboprop fans and the other using mechanically driven fans. The turboprop research technology aircraft reflects maximum usage of existing airframe components. The propulsion system consists of three turboprop fans pneumatically interconnected to three gas generators. Thrust modulation is accomplished by use of energy transfer and control system and thrust reduction modulation. This system can also be operated in the two engine/three fan mode. The mechanical RTA is virtually identical to the turboprop RTA with the exceptions that a different propulsion system and aft fuselage/tail are used. Both aircraft meet or exceed all of the mission performance guidelines and reflect a low cost, low risk approach. Author

A simplified method is presented for computing the installation losses of aircraft gas turbine propulsion systems. The method has been programmed for use in computer aided conceptual aircraft design studies that cover a broad range of Mach numbers and altitudes. The items computed are inlet size, pressure recovery, additive drag, subsonic spillage drag, bleed and bypass drags, auxiliary air systems drag, boundary-layer diverter drag, nozzle boattail drag and the interference drag on the region adjacent to multiple nozzle installations. The methods for computing each of these installation effects are described and computer codes for the calculation of these effects are furnished. The results of these methods are compared with selected data for the F-5A and other aircraft. The computer program can be used with uninstalled engine performance information which is currently supplied by a cycle analysis program. The program, including comments, is about 600 FORTRAN statements long, and uses both theoretical and empirical techniques. Author

A rapid and simple inviscid technique for designing forebodies which produce uniformly precompressed flows at the entrance for bottom-mounted scramjets was developed so that geometric constraints resulting from design trade-offs can be effectively evaluated. The flow fields resulting from several forebody designs generated in support of a conceptual design for a hypersonic research airplane have been analyzed in detail. Three-dimensional characteristics calculations were used to verify the uniform flow conditions. For the designs analyzed, uniform flow was maintained over a wide range of flight conditions (Mach numbers from 4 to 10, angles of attack of 6 and 10 deg) corresponding to the scramjet operation flight envelope of the research airplane. THE MALCOLM HORIZON

K E Money, R E Malcolm, and P J Anderson. In its Visual Presentation of Cockpit Information Including Special Devices Used for Particular Conditions of Flying Nov 1976 3 p ref.

Avail NTIS HC A05/MF A01

The Malcolm Horizon is a bar of light which shines across

the instrument panel of an aircraft cockpit driven by motors so as to move in a manner corresponding to the real horizon outside the aircraft. The motion is controlled by servo-motors which are driven by signals derived from the gyro platform of the aircraft. A series of simulator trials and flight trials have been carried out on the device in an attempt to evaluate it and further develop it and to evaluate aircrew performance while using the device. The trials showed that the bar of light is very compelling and is in constant view regardless of where the gaze may be directed and does not interfere with the normal reading of the instruments. All of the pilots who have flown with the Malcolm Horizon reacted positively and would welcome the addition of this device to the cockpit. Author

An experiment was conducted to determine whether low altitude terrain following flight could be accomplished better with stereo television than with conventional two-dimensional television. Nine subjects, both pilots and nonpilots, flew a simulated F-4 aircraft using only the information supplied by an air-to-ground television system. The simulation system consisted of 12- by 30-foot 2 000 1 scale terrain model, a gantry system carrying the television camera, a moving base cockpit and associated computer hardware that provided the proper control stick responses. The subject's task was to fly as low as possible across a 9 mile flight corridor without going below 250 feet above ground level. A single path that varied from sea level to 4 000 feet and at a constant airspeed of 300 knots was flown by all subjects. The subjects could control only the vertical dimension of the aircraft's flight. Author

Donald E Thompson 1976 223 p

Avail Univ Microfilms Order No 76-29684

Various aspects of the time-dependent forces and moments generated by marine propellers due to operating a nonuniform velocity field were analyzed. The response of a propeller to both a spatially and temporally nonuniform flow field was considered. The propeller time-dependent response to each type of nonuniform flow was treated analytically and predictions were made which were compared to experimentally determined values of unsteady propeller thrust. Two fundamentally different analytical approaches were considered for predicting response to spatial variations in the inflow. One approach employed a modified unsteady, two-dimensional airfoil theory. The second approach employed a lifting surface theory. An experimental program was conducted in which measurements of the time-dependent thrust generated by a series of propellers operating in a strut wake were made. Dissert Abstr

A study was conducted to define specific ground to flight effects on the noise of a low bypass ratio engine. The analysis was based on acoustic data recorded during the FAA-sponsored 727 Noise Retrofit Feasibility Program. Two configurations, a baseline and an ejector suppressor nacelle, were included in the study. Noise flight effects were obtained by comparing JT8D ground static and 727/JT8D flight acoustic data. Procedures

are defined for normalizing static and flight data to common conditions. The analysis considered both jet and fan noise characteristics for five engine power settings. The results will provide a guideline for establishing flight effects technology.

AMBIENT TEMPERATURE AND HUMIDITY CORRECTION FACTORS FOR EXHAUST EMISSIONS FROM TWO CLASSES OF AIRCRAFT TURBINE ENGINES. Final Report, Feb 1974 - Aug 1975

Louis Allen and Gerald R. Slusher. Oct 1976. 111 p. refs.
(AD-A031923/6, FAA-NA-76-16, FAA-RD-76-149). Avail
NTIS HC A05/MF A01 CSCL 21/5

Correction coefficients to reduce the production of exhaust emissions to standard day conditions for ambient temperature and humidity were developed for two classes of aircraft turbine engines. Correlation and multiple regression methods were utilized in the analysis of emission measurements recorded from two turbine engines operated under naturally occurring environmental conditions starting in the winter and continuing through the summer season. Correction factors were established for the emission index (EI) and power index (PI) for carbon monoxide (CO), total hydrocarbons (THC), and nitrogen oxides (NOx) for each of five engine power conditions of idle, approach, cruise, maximum continuous, and takeoff. Ambient temperature produced the dominant effect on all gaseous emissions. EI and PI for THC required the greatest magnitude of ambient temperature correction factors. Humidity had a significant secondary effect on the generation of NOx.

NTIS HC A04/MF A01 CSCL 21/5

The purpose of this research program was to develop a vane type hydraulic starter motor for aircraft high-speed auxiliary power units. The goals were to achieve a starter cutoff speed of 50,000 RPM and an inlet pressure capability of 8000 PSIG maximum using MIL-H-5606 hydraulic oil as the working fluid. A balanced three element single eccentric vane motor has been designed and proved capable of operation at 30,000 RPM and 3000 PSIG. The 0.145 cu in/rev prototype motor had a 72% torque efficiency at the noted conditions. Although the design goals proved unattainable, the unique vane motor design demonstrated that high speed hydraulic motor operation is feasible. The inability of the vane tip/cam ring interface to survive the high vane tip surface speed and loading represents the major problem that must be eliminated if the goal conditions are to be achieved. Use of highly wear resistant vane and cam ring materials did not provide a solution to this difficult lubrication problem. The vane motor was not evaluated at the projected thermal extremes (-65 F to +130 F) and the proposed hydraulic starter system demonstration was not conducted when the operational limits were found to be far less than the original starter motor objectives.

An experimental development program was conducted to investigate the performance of a variable-area subsonic diffuser. The project goal was to improve the static pressure rise ratio of exhaust gas diffusers used with subsonic, high-bypass-ratio, front fan engines during direct-connect testing in ground test facilities. A one-tenth scale model of the TF-39 turbofan engine was used in the experiment. Diffuser performance data were recorded during model engine operation with cold air at five simulated power settings with five diffuser configurations. Test cell and engine cowl surface pressures were recorded to determine the influence of the exhaust gas diffuser on these pressures. Data from all configurations were analyzed to determine the effect of the exhaust gas diffusers on test cell and engine cowl pressures and to determine the diffuser pressure rise ratio. Test cell and engine surface pressure data were not affected by the diffuser configuration. The static pressure rise ratio of one variable-area diffuser configuration tested exceeded that of all others and a conventional 5-deg half-angle subsonic diffuser.

EFFECT OF DROOPED-NOSE FLAPS ON THE EXPERIMENTAL FORCE AND MOMENT CHARACTERISTICS OF AN OBLIQUE WING

Edward J. Hopkins and George H. Lovette. Washington, Nov 1976. 142 p. refs.

(NASA-TM-X-3398, A-6461). Avail NTIS HC A07/MF A01 CSCL 01C

Six-component experimental force and moment data are presented for a low aspect ratio oblique wing equipped with drooped-nose flaps and mounted on top of a body of revolution. These flaps were investigated on the downstream wing panel with the nose drooped 5 deg, 10 deg, 20 deg, and 30 deg, and on both wing panels with the nose drooped 30 deg. It was to determine if such flaps would make the moment curves more linear by controlling the flow separation on the downstream wing panel at high lift coefficients. The wing was elliptical in planform and had an aspect ratio of 6.0 (based on the unswept wing span). The wing was tested at sweep angles of 45 deg and 50 deg throughout the Mach number range from 0.25 to 0.95. The drooped-nose flaps alone were not effective in making the moment curves more linear, however, a previous study showed that Kruger nose flaps improved the linearity of the moment curves when the Kruger flaps were used on only the downstream wing panel equipped with drooped-nose flaps deflected 5 deg.

APPLICATION OF ACTIVE CONTROLS FOR THE REDUCTION OF FATIGUE LOADS. [TOEPASSING VAN ACTIVE CONTROLS VOOR DE VERLAGING VAN VERMOEIIENGSBELASTINGEN]

J. B. deJonge. 15 Dec 1975. 40 p. refs. In DUTCH, ENGLISH summary. Sponsored by Neth. Agency for Aerospace Programs (NLR-TR-75163-U). Avail NTIS HC A03/MF A01

The working principles of active control systems are explained. Specific attention is paid to the possibilities of reducing fatigue loads by means of active controls. Active controls may be and are being used to increase the fatigue life of aircraft with inadequate fatigue performance. It is shown that the weight saving that can be obtained with non-critical active control systems is very limited. Substantial gains can be obtained only from critical active controls applied in a rigorous CCV-concept.

The third flight research program using the variable stability X-22A aircraft was undertaken to investigate control display, and guidance requirements for VTOL instrument transitions. The primary purpose of the experiment was to provide meaningful data related to the interaction of aircraft control system and displayed information characteristics on pilot rating and performance during a steep decelerating descending transition from a representative forward velocity (100 Kt) to the hover completely under instrument conditions. Thirty-eight in-flight evaluations were performed of combinations of five generic display presentations, ranging from position-information-only to four-axis control directors, and five levels of control augmentation systems ranging from rate-augmentation-only to decoupled longitudinal and vertical velocity responses and automatic configuration changes. In addition, new guidance developments of fundamental importance to VTOL instrument terminal area operations including an Independent Thrust Vector Inclination Command (ITVIC) and a procedure for automatically switching between airspeed and ground speed tracking to account for headwinds and crosswinds, were conceived, designed and demonstrated during the experiment.

AN EVALUATION OF WINDOW GLASS FOR AIR TRAFFIC CONTROL TOWER CABS Final Report, Mar 1974 - Aug 1975

Lee E Paul J Roy Bradley, and Donald A Martin Oct 1976 43 p refs

(AD-A031924/4, FAA-NA-76-13, FAA-RD-76-105) Avail NTIS HC A03/MF A01 CSCL 11/7

Seven samples of commercially available glass were evaluated to determine their suitability for use in air traffic control tower cabs. Spectral transmissivity measurements were made on each sample for all wavelengths in the visible spectrum. A small experimental tower cab was constructed near the NAFEC airport, and controllers evaluated the samples in the tower cab under day, night, dawn and dusk viewing conditions. The controller ratings were analyzed and evaluated in terms of the optical transmissivity of the samples and the type of window, i.e., single pane and double pane. There were differences in the ratings of the samples and the relative merit of the samples depended, in part, on the time of day the ratings were made. An unexpected factor in the ratings was the appearance of internal reflections in the double pane windows at night.

The report supplies the theoretical background and design techniques needed by an engineer who is designing electrical insulation for high-voltage high-power components, equipment and systems on aircraft. A literature survey and abundant bibliography identify references that provide further data on the subjects of partial discharges, corona, field theory and plotting voids and processes for applying insulation. Both gaseous and solid insulations are treated. Cryogenic and liquid design notes are included. Tests and test equipment for high voltage insulation and equipment are defined. Requirements of test plans and procedures for high-voltage high-power equipment are identified and illustrated by examples. Suggestions for high-voltage specifications are provided. Very few of the Military and Government specifications deal with system voltages above 10kv, thus most aircraft high-voltage specifications will have to be derived from the power industry specifications and standards produced by ASTM, IEEE and NEMA.

A SHORT BACKFIRE ANTENNA FITTED WITH A WAVEGUIDE FEED

John A Strom and Hermann W Ehrenspeck May 1976 56 p refs

(AF Proj 5635)

(AD-A028910, RADCL-TR-76-148) Avail NTIS HC A04/MF A01 CSCL 09/5

A short backfire antenna incorporating an open-ended waveguide as its feed mechanism has been measured experimentally in three different structural configurations. A complete set of curves describing the directivity, sidelobe levels and half-power beamwidths as a function of frequency as well as a few of the more important radiation patterns are presented for each case. The effects obtained by varying parameters such as disk diameter and waveguide spacing are discussed, especially with regard to the directive gain and area illumination efficiency. Recommendations are made on techniques for fabrication, impedance matching and arraying antennas of this type for possible airframe applications.

The laminar separation taking place around the wedge-shaped trailing edge of a thin wing placed in an incompressible, two-dimensional flow at very high Reynolds numbers was studied by the method of matched asymptotic developments. In the case where dihedral effect is more important than the loss of adherence effect, a three-layer scheme was developed around the separation point. In the lower layer where viscous effects are preponderant, the flow is governed by a universal canonical problem containing only one parameter related to the separation location. The calculation of the asymptotic behavior of the solution of the canonical problem, at infinity both upstream and downstream of the viscous sublayer is mainly dealt with. Author (ESA)

The report summarizes the research prior to that described in Volume III and presents the results of the most recent research in some detail. This covers a broad spectrum of data on mechanical properties using a sensitive stick-slip friction apparatus the detection of molecular order and orientation in quiescently formed solution films using frustrated-multiple-internal-reflection infrared spectroscopy (FMIR) and in the determination of the thermodynamic properties of selected film species using ellipsometric techniques. Experiments were performed on rubbed stearic acid films on three substrates--iron, chromium and copper. Using carefully controlled surface contact conditions, very pure iron and chromium substrates were used to form surface films from straight-chain hydrocarbon solutions and ester-commercial additive systems. The mechanical properties - friction shear stress and damping - were studied utilizing films formed in situ. This is also true for the measurement of thermodynamic properties though no dynamic rubbing contact was involved in the ellipsometric determinations. GRA

FLAPWISE BENDING, CHORDWISE BENDING, TORSION
AND EXTENSION OF TWISTED ROTOR BLADES**

Raymond G Kvaternik and Krishna R V Kaza (George Washington Univ Hampton Va) Dec 1976 37 p refs
(NASA-TM-X-73997) Avail NTIS HC A03/MF A01 CSCL 13M

The nonlinear curvature expressions for a twisted rotor blade or a beam undergoing transverse bending in two planes torsion, and extension were developed. The curvature expressions were obtained using simple geometric considerations. The expressions were first developed in a general manner using the geometrical nonlinear theory of elasticity. These general nonlinear expressions were then systematically reduced to four levels of approximation by imposing various simplifying assumptions and in each of these levels the second degree nonlinear expressions were given. The assumptions were carefully stated and their implications with respect to the nonlinear theory of elasticity as applied to beams were pointed out. The transformation matrices between the deformed and undeformed blade-fixed coordinates, which were needed in the development of the curvature expressions were also given for three of the levels of approximation. The present curvature expressions and transformation matrices were compared with corresponding expressions existing in the literature. Author

**SUBJECTIVE ASSESSMENT OF SIMULATED HELICOPTER
BLADE-SLAP NOISE**

Ben William Lawton Washington Dec 1976 55 p refs
(NASA-TN-D-8359 L-11137) Avail NTIS HC A04/MF A01 CSCL 20A

The effects of several characteristics of helicopter blade slap upon human annoyance are examined. Blade slap noise was simulated by using continuous and impulsive noises characterized by five parameters. The number of sine waves in a single impulse, the frequency of the sine waves, the impulse repetition frequency, the sound pressure level (SPL) of the continuous noise, and the idealized crest factor of the impulses. Ten second samples of noise were synthesized with each of the five parameters at representative levels. The annoyance of each noise was judged by 40 human subjects. Analysis of the subjective data indicated that each of the five parameters had a statistically significant effect upon the annoyance judgments. The impulse crest factor and SPL of the continuous noise had very strong positive relationships with annoyance. The other parameters had smaller but still significant effects upon the annoyance judgments. Author

HC A07/MF A01 CSCL 20/1

The following topics are discussed: (1) An engineering calculation procedure which validly and reliably reflects annoyance to helicopter operations; (2) estimates of noise exposure levels which could be compatible with human activities in areas surrounding heliports; (3) noise exposure modeling for helicopter noise; and (4) certification measurement approaches for helicopter noise certification. The basics of the program involved human response evaluations of conventional takeoff and landing (CTOL) aircraft noise, simulations of helicopter noise emphasizing slap or pulsating noise effects, and recordings of a wide variety of helicopter operations. The main conclusion is that PndB with the FAR-36 duration correction reliably reflects annoyance to helicopter noise. No correction for slap or tone is required. Also, dB A sub D is almost as effective as PndB sub D for measuring effects of helicopter noise (duration effects are included). Elimination of heavy slap is equivalent to a maximum of a 2 to 3 dB A reduction relative to annoyance response. Author

(NASA-CR-2628 PWA-5296) Avail NTIS HC A07/MF A01 CSCL 01B

The static aerodynamic and acoustic characteristics of duct-burning turbofan (DBTF) exhaust nozzles are established. Scale models, having a total area equivalent to a 0.127 m diameter convergent nozzle, simulating unsuppressed coannular nozzles and mechanically suppressed nozzles with and without ejectors (hardwall and acoustically treated) were tested in a quiescent environment. The ratio of fan to primary area was varied from 0.75 to 1.2. Far field acoustic data, perceived noise levels and thrust measurements were obtained for 417 test conditions. Pressure ratios were varied from 1.3 to 4.1 in the fan stream and from 1.53 to 2.5 in the primary stream. Total temperature varied from 395 to 1090 K in both streams. Jet noise reductions, relative to synthesized prediction from 8 PNdB (with the unsuppressed coannular nozzle) to 15 PNdB (with a mechanically suppressed configuration) were observed at conditions typical of engines being considered under the Advanced Supersonic Technology program. The inherent suppression characteristic of the unsuppressed coannular nozzle is related to the rapid mixing in the jet wake caused by the velocity profiles associated with the DBTF. Since this can be achieved without a mechanical suppressor, significant reductions in aircraft weight or noise footprint can be realized. Author

(NASA-TM-X-74003) Avail NTIS HC A04/MF A01 CSCL 01A

For identical increases in bending moment, a winglet provides a greater gain in induced efficiency than tip extension. Winglet toe angle allows design trades between efficiency and root

moment. A winglet shows the greatest benefit when the wing loads are heavy near the tip. Washout diminishes the benefit of either tip modification, and the gain in induced efficiency becomes a function of lift coefficient; thus heavy wing loadings obtain the greatest benefit from a winglet, and low-speed performance is enhanced even more than cruise performance. Both induced efficiency and bending moment increase with winglet length and outward cant. The benefit of a winglet relative to a tip extension is greatest for a nearly vertical winglet. Root bending moment is proportional to the minimum weight of bending material required in the wing; thus it is a valid index of the impact of tip modifications on a new wing design. Author

A theory is developed in order to calculate the pressure distribution on the blades of a helicopter rotor in forward flight. Neglecting the influence of viscosity, the velocity-potential is obtained as well as the pressure field wave equations with a nonlinear term. Following the theory of wave equations, the influence of accelerated moving shocks on the flow is represented by sink-distributions on the shock surfaces. Similarly, the loading and thickness-effects of the rotor blades are described by dipoles and source-sink-distributions on the foils. Author

(NASA-TM-X-3479 E-8945) Avail NTIS HC A03/MF A01 CSCL 01A

The overall performance of a transonic fan stage is presented for various tip clearances, with and without casing treatment. The stage was tested with a solid casing, and with open skewed slots and closed skewed slots in the casing over the rotor blade tips. Four nominal nonrotating rotor blade tip clearances from 0.061 to 0.178 centimeter were used. For all three casings, the pressure ratio and efficiency decreased with increasing tip clearance. The stall margin for a given casing also decreased with increasing clearance. At design speed and a given tip clearance, the highest stall margin was obtained with the open-slot casing, and the lowest stall margin was obtained with the solid casing. Author

N77-16993* National Aeronautics and Space Administration, Marshall Space Flight Center, Huntsville, Ala. **NUMERICAL SOLUTIONS OF NAVIER-STOKES EQUATIONS FOR THE STRUCTURE OF A TRAILING VORTEX.** A. C. Jain. Jan 1977. 66 p. refs.
(NASA-TM-X-73361) Avail NTIS HC A04/MF A01 CSCL 01A

The structure and decay of a trailing vortex were analyzed during the numerical solutions of the full Navier-Stokes equations. Unsteady forms of the governing equations were recast in terms of circulation, vorticity, and stream function as dependent variables, and a second upwind finite difference scheme was used to integrate them with prescribed initial and boundary conditions. The boundary conditions at the outer edge and at the outflow section of the trailing vortex were considered. Different models of the flow were postulated and solutions were obtained describing the development of the flow as integration proceeds.

in time A parametric study was undertaken with a view to understanding the various phenomena that may possibly occur in the trailing vortex Using the Hoffman and Joubert law of circulation at the inflow section, the results of this investigation were compared with experimental data for a Convair 990 wind model and a rectangular wing With an exponentially decaying law of circulation at the inflow section and an adverse pressure gradient at the outer edge of the trailing vortex, solutions depict vortex bursting through the sudden expansion of the core and/or through the stagnation and consequent reversal of the flow on the axis It was found that this bursting takes place at lower values of the swirl ratio as the Reynolds number increases

 (Contract NAS1-12821)

(NASA-CR-2777) Avail NTIS HC A05/MF A01 CSDL 01A

The method described utilizes a nonorthogonal coordinate system for boundary-layer calculations It includes a geometry program that represents the wing analytically and a velocity program that computes the external velocity components from a given experimental pressure distribution when the external velocity distribution is not computed theoretically The boundary layer method is general however and can also be used for an external velocity distribution computed theoretically Several test cases were computed by this method and the results were checked with other numerical calculations and with experiments when available A typical computation time (CPU) on an IBM 370/165 computer for one surface of a wing which roughly consist of 30 spanwise stations and 25 streamwise stations, with 30 points across the boundary layer is less than 30 seconds for an incompressible flow and a little more for a compressible flow

The effects of dynamic stall on airfoils oscillating in pitch were investigated by experimentally determining the viscous and inviscid characteristics of the airflow on the NACA 0012 airfoil and on several leading-edge modifications The test parameters included a wide range of frequencies Reynolds numbers and amplitudes-of-oscillation Three distinct types of separation development were observed within the boundary layer each

leading to classical dynamic stall The NACA 0012 airfoil is shown to stall by the mechanism of abrupt turbulent leading-edge separation A detailed step-by-step analysis of the events leading to dynamic stall, and of the results of the stall process, is presented for each of these three types of stall Technique for flow analysis in the dynamic stall environment are discussed A method is presented that reduces most of the oscillating airfoil normal force and pitching-moment data to a single curve independent of frequency or Reynolds number

In a series of wind tunnel tests, measurements were made of the aerodynamic loads acting on eight different store configurations supported in and near the external captive position on a 1/20-scale model of the F-4C aircraft. Store models included blunt and contoured afterbody shapes, stable and unstable configurations and large (pylon-mounted) and small (rack-mounted) configurations. Six components of forces and moments were measured using two methods of supporting the store models: an internal bracket support technique (IBS) and a dual sting support technique. Some characteristics of the interference flow field of the aircraft were also inferred. GRA

A Traffic Control and Landing Systems (TRACALS) Communications Station Evaluation was performed at Kadena AB Japan (1962 Comm Sq) from 4 March through 16 March 1976. The purpose of the evaluation was to define the capabilities and limitations of the air traffic control VHF/UHF communications systems. Included in this report are results and analysis of equipment checks, loop test line level diagrams for the RAPCON and control tower systems, line of sight coverage data, analysis of airborne measurements and plots of UHF radiation patterns. In addition, there is included a discussion of transmitter and receiver frequency accuracy test equipment, VHF isolators, RAPCON keying system modification to AN/GRT-18 transmitters and Rivet Switch receiver output levels. The data and diagrams in this report can be used as guides for anticipated performance of the communications system at Kadena AB until there is an addition, deletion, relocation of equipment, or change in horizon.

profile which would affect the system. The principles presented are valid for other locations using the same communications equipment. Author (GRA)

US Patent Office CSCL 01C

Improved stability was provided in a hingeless helicopter rotor by inclining the principal elastic flexural axes and coupling pitching of the rotor blade with the lead-lag bending of the blade. The primary elastic flex axes were inclined by constructing the blade of materials that display non-uniform stiffness, and the specification described various cross section distributions and the resulting inclined flex axes. Arrangements for varying the pitch of the rotor blade in a predetermined relationship with lead-lag bending of the blade, i.e., bending of the blade in a plane parallel to its plane of rotation were constructed.

HC A14/MF A01 CSCL 01C

Ground static and wind tunnel test of a scale model modified T-39 airplane are reported. The configuration in the nose and replacement of the existing nacelles with tilting lift/cruise fans. The model was powered with three 14 cm diameter tip driven turbopowered simulators. Forces and moments were measured by an internal strain gauge balance. Engine simulator thrust and mass flow were measured by calibrated pressure and temperature instrumentation mounted downstream of the fans. The low speed handling qualities and general aerodynamic characteristics of the modified T-39 were defined. Test variables include thrust level and thrust balance, forward speed, model pitch and sideslip angle at forward speeds, model pitch, roll, and ground height during static tests. Lift/cruise fan tilt angle, flap and aileron deflection angle, and horizontal stabilizer angle. The effects of removing the landing gear, the lift/cruise fans, and the tail surfaces were also investigated. Author

HC A08/MF A01 CSCL 01C

Studies of transport aircraft designed for boom-free supersonic flight show the variable sweep oblique wing to be the most efficient configuration for flight at low supersonic speeds. Use of this concept leads to a configuration that is lighter, quieter and more fuel efficient than symmetric aircraft designed for the same mission. Aerodynamic structural weight, aeroelastic and flight control studies show the oblique wing concept to be technically feasible. Investigations are reported for wing planform and thickness pivot design and weight estimation engine cycle (bypass ratio) and climb descent and reserve fuel. Results are incorporated into a final configuration. Performance, weight and balance characteristics are evaluated. Flight control requirements are reviewed, and areas in which further research is needed are identified.

A study of the design and analysis on winglets for military aircraft has been completed. The program consisted of investigating analytically winglet concepts for application to the KC-135 and C-141 designing and building winglets for an O035 and O070 scale model KC-135, and conducting a structural feasibility investigation of the winglet installation on the KC-135. The analysis of the winglets showed a 14% reduction in induced drag for the KC-135 and a 11% reduction for the C-141. The

structural design study of the KC-135A winglet installation estimated a 592 lb weight increase. An 8.4% improvement was estimated in M(L/D) sub MAX and an 8.1% improvement in range factor for the KC-135A. An O070 scale half span KC-135 wind tunnel model has been tested in the NASA 8 ft Transonic Tunnel. Preliminary unpublished test data have substantiated the analytical procedures used by The Boeing Company to determine the aerodynamic characteristics and performance benefits from winglets on the KC-135 aircraft.

The requirement for the U.S. Coast Guard to rapidly deploy antipollution equipment to offshore or remote sites generated a proposal to utilize an HH-3F helicopter to tow a planing hull Fast Surface Delivery (FSD) sled. The proposal was unique in that the mass of the towed surface vessel equalled or exceeded the mass of towing helicopter. The U.S. Naval Air Test Center undertook the design and fabrication of prototype hardware and the development of towing techniques and a recommended flight envelope. The design was driven by a requirement for the towing equipment to be two man transportable, manually operable, and easily removable. Two significant features of the resulting design were the use of a Kevlar 49 towing cable and the development of a quick-release hook capable of repeated releases at rated load. Flight testing revealed two families of power required curves as functions of the FSD sled operation as a displacement or planing hull. There was also a measurable sensitivity to the center of gravity location of the FSD sled. FSD sled reactions to sea states caused divergent oscillations in tow tension which could be easily damped by pilot technique. The development and test program demonstrated the suitability of helicopters to perform as a high-speed towing vehicle for very rapid overwater delivery of payloads not otherwise air transportable or rapidly surface deliverable.

HC A02/MF A01

Cockpit lighting in U S Army helicopters was investigated for compatibility with use of night-vision goggles AN/PVS-5. Instrument-lighting systems in existing Army helicopters, e.g. eyebrow lighting post lighting are not suitable for use with night-vision goggles. A comparatively simple flood-lighting system can provide suitable lighting in the cockpit of existing helicopters for reading instruments with night-vision goggles. The most suitable instrument-lighting system for use with the goggles is integral instrument lighting, however, indicator lights need to be modified so they are compatible with the goggles. Methods were investigated for instantaneously refocussing the goggles inside the cockpit. Luminance levels compatible for use with night-vision goggles are stated in photometric terms. Author (GRA)

This report describes a program of in-flight vibration measurements carried out on a platform mounted atop the rotor mast on the UH-1M helicopter. Results of a real time analysis of the data are presented which reveal that a low level of vibration exists at that site making it a good location for the future placement of fire control instrumentation. A mechanical impedance study is also presented which shows that much of the high frequency present in the acceleration-time histories is a result of resonances in the tested platform. Author (GRA)

The objective of this study was to assess the capability of main transmissions, intermediate gearboxes tail rotor gearboxes, main rotor hubs and swashplates on the UH-1 and AH-1 to operate with no scheduled overhaul periods. Overhaul and accident records inspection procedures, and the functional capability of the caution and warning subsystem and its condition-monitoring devices were examined, and failure mode, effects and criticality analyses were performed to determine if any part or assembly failure modes would limit on-condition maintenance capability. This report concludes that UH-1/AH-1 helicopter drive system components have a capability for replacement for overhaul on an on-condition basis and that the overhaul intervals could be extended for some components or

eliminated for others. The report includes recommendations for further study. GRA

HC A05/MF A01 CSCL 01/3

The effectiveness of the Scout helicopter employed as an aerial observation platform was determined. Factors used to assess this effectiveness were Scout-to-target range, Scout tactics, target motion, and level of aerial observer training and experience. Variables recorded during the experiment and used for this analysis included observer task times, Scout exposure times, observer's artillery fire direction and adjustment errors and threat force's ability to locate the Scout position. Results of analysis indicate those factors that had a significant effect on the measures of effectiveness and define an optimum operating procedure for artillery fire support missions using the Scout helicopter. Under the most favorable conditions encountered in Phase IIB the aerial observer was exposed to the target an average of approximately 50 seconds in order to successfully complete detection, location call for fire, and subsequent artillery adjustment. The object of this research effort was to provide a responsive target for air combat simulation on the Dynamic Environment Simulator located at Aerospace Medical Research Laboratory. Accomplishment of this effort required review of alternative aerial combat maneuvering models to establish an acceptable technical approach for the Smart Target tactics model. An aircraft model was then developed using dynamics representative of an F-4E or J aircraft from aerodynamic tables. The models were incorporated in a computer program that will be implemented by AMRL. Author (GRA)

Three functions must be interfaced with the responsive target computer program for this target to operate in real time. First the program must be tied to a real clock. The integration interval employed in the program is 0.1 second, thus a 0.1-second clock

rate must be provided to the system. Second, the position, velocity, and attitude information concerning the state of the opponent must be provided to the program. The information will be obtained from analog voltages ranging from -10 to 10 volts that will be read into the Pacer 100 by an analog to digital converter. Third, the position and attitude of the target must be presented to the pilot in the opponent aircraft. These variables will also be provided as analog voltages and require a digital to analog conversion step. Author (GRA)

This report describes a rotorcraft nonlinear simulation called REXOR and is divided into three volumes. The first volume is a development of rotorcraft mechanics and aerodynamics. The second is a development and explanation of the computer code required to implement the equations of motion. The third volume is a user's manual and contains a description of code input/output as well as operating instructions. The REXOR math model has been written for a single four-bladed, gyro-controlled hingeless-rotor helicopter with additional capability for analysis of teeter or hinge-offset rotor systems with conventional controls and two or four blades. The helicopter modeled may be conventional in design winged or compounded. Modeling emphasis is on an accurate main rotor description with additional degrees of freedom to describe the rest of the helicopter. REXOR has been implemented on IBM 360 and CDC 6000 series equipment. The operating instructions are primarily based on the 360 equipment usage with additional instructions to show use on the 6000 series equipment. Author (GRA)

This report uses the results of Contract DAAJ01-73-C-0282 (P3L) Elastic Pitch Beam Tail Rotor Study for LOH Class Helicopters and Contract DAAJ01-72-C-0006 Elastic Pitch Beam Tail Rotor, for selecting the most promising concepts to establish detailed designs that are applicable to LOH class helicopters. The designs studied herein included removable/replaceable blade airfoil shells, damage/erosion-resistant leading edge and damage tolerant/repairable trailing edge. The elimination of bearings was an important design objective, where bearings were required, consideration was given to the use of elastomeric bearings. Improvements in reliability and maintainability, repairability, cost, performance and producibility along with interchangeability with existing tail rotor systems were also prime considerations in the design selection. DESIGN AND TESTING OF THE H-63, 450-GALLON AUXILIARY FUEL TANK CONTAINER

Richard T Gibbons Jun 1976 18 p
 (AFPEA Proj 75-P7-37)
 (AD-A028283 DSPD-76-10) Avail NTIS HC A02/MF A01
 CSDL 01/3

HQ TAC/LGT has proposed through WR-ALC/DSP a container design project to the Air Force Packaging Evaluation Agency (AFPEA) relative to development of a transport device/container for auxiliary fuel tanks used with the H-53 helicopter. The container(s) are essential to rapid deployment of the H-53

in contingency response situations. Since the helicopter cannot be ferried worldwide, and still meet planning/timing considerations, the H-53 is partially disassembled and moved via the C-5 Galaxy aircraft. The helicopter, however, will not fit into the C-5 with its auxiliary fuel tanks attached, also, to be air-shippable, these tanks must be purged of jet fuel fumes in accordance with AFM 71-4. This is a process normally involving 72 hours. The AFPEA has developed a sturdy handling device/container that will allow the H-53 tanks to be safely moved when partially filled with jet fuel. This container has been subjected to strenuous vibration and mechanical handling tests along with the fit and function tests and as a system it is fully qualified to satisfy the design criteria. The current cost of this container is well under \$350 including labor and materials. GRA

Test results at design speed show fan total pressure ratio weight flow and adiabatic efficiency to be 2.2, 2.9, and 1.8% lower than design goal values. The hybrid acoustic inlet (which utilizes a high throat Mach number and acoustic wall treatment for noise suppression) demonstrated total pressure recoveries of 98.9% and 98.2% at takeoff and approach. Exhaust duct pressure losses differed between the hardwall duct and treated duct with splitter by about 0.6% to 2.0% in terms of fan exit average total pressure (depending on operating condition). When the measured results were used to estimate pressure losses a cruise sfc penalty of 0.68%, due to the acoustically treated duct, was projected. Author

A description is presented of the development of the boundary layer on the lip and diffuser surface of a subsonic inlet at arbitrary operating conditions of mass flow rate, free stream velocity and incidence angle. Both laminar separation on the lip and turbulent separation in the diffuser are discussed. The agreement of the theoretical results with model experimental data illustrates the capability of the theory to predict separation. The effects of throat Mach number inlet size and surface roughness on boundary layer development and separation are illustrated. Author

CORE NOISE MEASUREMENTS ON A YF-102 TURBOFAN ENGINE

Meyer Reshotko Allen Karchmer, Paul F Penko, and Jack G McArdle 1977 27 p refs Presented at 15th Aerospace Sci Meeting, Los Angeles, 24-26 Jan 1977, sponsored by AIAA
(NASA-TM-X-73587, E-9050) Avail NTIS HC A03/MF A01 CSCL 20A

Core noise from a YF-102 high bypass ratio turbofan engine was investigated through the use of simultaneous measurements of internal fluctuating pressures and far field noise. Acoustic waveguide probes, located in the engine at the compressor exit in the combustor, at the turbine exit and in the core nozzle, were employed to measure internal fluctuating pressures. Spectra showed that the internal signals were free of tones except at high frequency where machinery noise was present. Data obtained over a wide range of engine conditions suggest that below 60% of maximum fan speed the low frequency core noise contributes significantly to the far field noise. Author

THE EFFECT OF FORWARD SPEED ON J85 ENGINE NOISE FROM SUPPRESSOR NOZZLES AS MEASURED IN THE NASA-AMES 40- BY 80-FOOT WIND TUNNEL

Adolph Atencio Jr Washington Feb 1977 67 p refs
(NASA-TN-D-8426 A-6592) Avail NTIS HC A04/MF A01 CSCL 20A

An investigation to determine the effect of forward speed on the exhaust noise from a conical ejector nozzle and three suppressor nozzles mounted behind a J85 engine was performed in a 40- by 80-foot wind tunnel. The nozzles were tested at three engine power settings and at wind tunnel forward speeds up to 91 m/sec (300 ft/sec). In addition outdoor static tests were conducted to determine (1) the differences between near field and far field measurements (2) the effect of an airframe on the far field directivity of each nozzle and (3) the relative suppression of each nozzle with respect to the baseline conical ejector nozzle. It was found that corrections to near field data are necessary to extrapolate to far field data and that the presence of the airframe changed the far field directivity as measured statically. The results show that the effect of forward speed was to reduce the noise from each nozzle more in the area of peak noise but the change in forward quadrant noise was small or negligible. A comparison of wind tunnel data with available flight test data shows good agreement. Author

HC A11/MF A01 CSCL 21E

An opposed reacting jet combustor (ORJ) was tested at a pressure of 1 atmosphere. A premixed propane/air stream was stabilized by a counterflowing jet of the same reactants. The

resulting intensely mixed zone of partially reacted combustion products produced stable combustion at equivalence ratios as low as 0.45. Measurements are presented for main stream velocities of 7.74 and 13.6 m/sec with an opposed jet velocity of 96 m/sec inlet air temperatures from 300 to 600 K, and equivalence ratios from 0.45 to 0.625. Fuel lean premixed combustion was an effective method of achieving low NO_x emissions and high combustion efficiencies simultaneously. Under conditions promoting lower flame temperature, NO₂ constituted up to 100 percent of the total NO_x. At higher temperatures this percentage decreased to a minimum of 50 percent. Author

INTERNAL FLOW CHARACTERISTICS OF A MULTISTAGE COMPRESSOR WITH INLET PRESSURE DISTORTION

Claude E. DeBogdan, John E. Moss, Jr., and Willis M. Braithwaite
 Washington Feb 1977 39 p refs
 (NASA-TM-X-3446, E-8848) Avail NTIS HC A03/MF A01 CSCL 21E

The measured distribution of compressor interstage pressures and temperatures resulting from a 180 deg inlet-total-pressure distortion for a J85-13 turbojet engine is reported. Extensive inner stage instrumentation combined with stepwise rotation of the inlet distortion gave data of high circumferential resolution. The steady-state pressures and temperatures along with the amplitude, extent and location of the distorted areas are given. Data for 80, 90, and 100 percent of rotor design speed are compared with clean (undistorted) inlet flow conditions to show pressure and temperature behavior within the compressor. Both overall and stagewise compressor performances vary only slightly when clean and distorted inlet conditions are compared. Total and static pressure distortions increase in amplitude in the first few stages of the compressor and then attenuate fairly uniformly to zero at the discharge. Total-temperature distortion induced by the pressure distortion reached a maximum amplitude by the first two stages and decayed only a little through the rest of the compressor. Distortion amplitude tended to peak in line with the screen edges and, except for total and static pressure in the tip zone, there was little swirl in the axial direction. Author

Experimental investigations of the possibilities of shielding jet engine noise through changes to aircraft configuration were carried out with a 1:10 scale aircraft half-model. Several configurations with the engines mounted above the wing were investigated in a reflection free room. A fan model with nacelle having the same scale as the aircraft model was used as a noise source. The results from these investigations were used to optimize a computer program developed for the Europlane project, for the calculation of noise emission from noise shielded configurations. In addition to the acoustic measurements, aerodynamic interference effects were investigated for noise shielded nacelle configurations on a typical transport aircraft having a transonic wing profile. (AD-A028882 PWA-5415 AFAL-TR-76-45) Avail NTIS HC A04/MF A01 CSCL 21/5

Critical response time may be defined as the time period or duration of a compressor inlet flow distortion required for a significant effect on compressor stability. The knowledge of this time period is important as a basis for evaluating time variant inlet distortion data for its potential impact on compressor stall margin. This period can be related to the time required for fluid to travel the length of a compressor by defining a reduced frequency parameter. Critical response time can be defined for any compressor once the critical value of reduced frequency is ascertained. Results of a mathematical model of a compressor system demonstrate that the critical value of reduced frequency is between 1.0 and 5.0. An inspection of available data indicates that a value of approximately 2.0 is the critical value. GRA

This report documents a conceptual development program the bulk of which was performed by Chandler-Evans Controls Systems Division of Colt Industries as sub-contractor to the Detroit Diesel Allison Div of GMC. This Air Force funded program demonstrates the feasibility of integrating a starting fuel pump with an existing centrifugal pump to serve as a main engine fuel pump for a joint technology demonstrator turboprop engine. A retracting vane concept was designed to provide starting fuel flow up to a speed where the vanes retract and the vapor core pump takes over. An inlet throttle valve controls pump output to meet engine demand. The combined pump was fabricated and tested at all speeds up to and including max speed of 28,000 rpm and met light off transition and max flow and pressure requirements. Weight and cost estimates are 50% of present-state-of-the-art pumps. This report contains detailed design information and preliminary test results that dictated redesign and the final successful test results. In addition to favorable cost and weight estimates, appreciable reduction of fuel heating is demonstrated due to its inlet throttled non-bypassing operating mode. Author (GRA)

Exhaust gas pollutant emissions data under test stand conditions were obtained for the following (1) full-rich baseline test (7-mode cycle) (2) lean-out tests for each power mode, and (3) different spark settings The test data were also used to create a theoretical 5-mode cycle baseline The emissions data in the framework of the theoretical 5-mode cycle were emphasized There is no significant difference in the test results produced by data exhibited on the 7-mode cycle or 5-mode cycle The 5-mode cycle was slightly more conservative for the carbon monoxide pollutant than the 7-mode cycle The data were evaluated to determine which mode(s) had the greatest influence on improving general aviation piston engine emissions Improvements that were achieved as a result of making lean-out adjustments to the fuel metering device were (1) taxi mode only, (2) taxi and approach modes combined and (3) leaning-out of the climb mode to best power Author

The Avco Lycoming flight test program for reduced emissions was conducted to determine and document the lean fuel schedule limits for current production aircraft based on flight safety Based on analysis of the emissions profile Avco Lycoming proposed to evaluate the effect of leaner schedules in the idle/taxi, climb, and approach modes These modes were selected as areas where it was felt that possible improvements could be made with the greatest improvement in cyclic emissions reduction The fuel systems to produce these leaner stepped fuel schedules were tailored specifically for the flight test Author

Five different engine models were tested covering combinations of all engine categories in current production in the range from 100 to 435 brake horsepower Engines were divided into five major types carbureted, fuel injected direct drive geared, and turbocharged Emissions data were categorized by three separate fuel system schedules baseline, case 1, and case 2 Baseline was defined as the average fuel flow rate established by the fuel system's production tolerance band when operated with the mixture control at the full-rich position Case 1 was defined as the minimum allowable fuel flow rate established by the engine certification Case 2 was defined as the fuel rate corresponding to the leanest fuel-air ratio obtainable before a safety limit occurred with the engine operating on a propeller test stand Safety limits that developed during testing were cylinder-head overheating or inadequate acceleration from a given mode of operation Author

FLIGHT TEST SUMMARY OF MODIFIED FUEL SYSTEMS

Bruce G Barrett /In NASA Lewis Res Center Aircraft Piston Eng Exhaust Emissions Symp Sep 1976 p 209-224

Avail NTIS HC A16/MF A01 CSCL 21E

Two different aircraft designs, each with two modified fuel control systems, were evaluated Each aircraft was evaluated in a given series of defined ground and flight conditions while quantitative and qualitative observations were made During this program some ten flights were completed and a total of about 13 hours of engine run time was accumulated by the two airplanes The results of these evaluations with emphasis on the operational

and safety aspects were analyzed. Ground tests of the engine alone were not able to predict acceptable limiting lean mixture settings for the flight envelopes of the Cessna Models 150 and T337

TCM AIRCRAFT PISTON ENGINE EMISSION REDUCTION PROGRAM
Bernard Rezy *In NASA Lewis Res Center Aircraft Piston Eng Exhaust Emissions Symp* Sep 1976 p 227-254

(Contract NAS3-19755)

Avail NTIS HC A16/MF A01 CSCL 21E

The technology necessary to safely reduce general aviation piston engine exhaust emissions to meet the EPA 1980 Emission Standards with minimum adverse effects on cost, weight, fuel economy and performance was demonstrated. A screening and assessment of promising emission reduction concepts was provided, and the preliminary design and development of those concepts was established. A system analysis study and a decision making procedure were used by TCM to evaluate, trade off and rank the candidate concepts from a list of 14 alternatives. Cost emissions and 13 other design criteria considerations were defined and traded off against each candidate concept to establish its merit and emission reduction usefulness. A computer program was used to aid the evaluators in making the final choice of three concepts.

EMISSIONS AND NEW TECHNOLOGY PROGRAMS FOR CONVENTIONAL SPARK-IGNITION AIRCRAFT ENGINES
William T Wintucky *In its Aircraft Piston Eng Exhaust Emissions Symp* Sep 1976 p 295-314

Avail NTIS HC A16/MF A01 CSCL 21E

A long-range technology plan in support of general aviation engines was formulated and is being implemented at the Lewis Research Center. The overall program was described and that part of the program that represents the in-house effort at Lewis was presented in detail. Three areas of government and industry effort involving conventional general-aviation piston engines were part of a coordinated overall plan: (1) FAA/NASA joint program, (2) NASA contract exhaust emissions pollution reduction program, and (3) NASA in-house emissions reduction and new technology program.

ALTERNATIVE GENERAL-AIRCRAFT ENGINES
William A Tomazic *In its Aircraft Piston Eng Exhaust Emissions Symp* Sep 1976 p 315-328

Avail NTIS HC A16/MF A01 CSCL 21E

The most promising alternative engine (or engines) for application to general aircraft in the post-1985 time period was defined and the level of technology was cited to the point where confident development of a new engine can begin early in the 1980's. Low emissions, multifuel capability, and fuel

economy were emphasized. Six alternative propulsion concepts were considered to be viable candidates for future general-aircraft application: the advanced spark-ignition piston, rotary combustion, two- and four-stroke diesel, Stirling, and gas turbine engines.

SUMMARY OF THE GENERAL AVIATION MANUFACTURERS' POSITION ON AIRCRAFT PISTON ENGINE EMISSIONS
J Lynn Helms *In NASA Lewis Res Center Aircraft Piston Eng Exhaust Emissions Symp* Sep 1976 p 329-336

Avail NTIS HC A16/MF A01 CSCL 21E

The General Aviation Manufacturers recommended that the EPA rescind the aircraft piston engine emissions regulations currently on the books. The reason was the very small emission reduction potential and the very poor benefit-cost ratio involved in this form of emission reduction. The limited resources of this industry can far better be devoted to items of much greater benefit to the citizens of this country - reducing noise, improving fuel efficiency (which will incidentally reduce exhaust emissions), and improving the safety, operational and economic aspects of aircraft, all far greater contributions to our total national transportation system.

REVIEW OF MEASUREMENT AND TESTING PROBLEMS
In NASA Lewis Res Center Aircraft Piston Eng Exhaust Emissions Symp Sep 1976 p 337-356

Avail NTIS HC A16/MF A01 CSCL 21E

Good instrumentation was required to obtain reliable and repeatable baseline data. Problems that were encountered in developing such a total system were: (1) accurate airflow measurement, (2) precise fuel flow measurement and (3) the instrumentation used for pollutant measurement was susceptible to frequent malfunctions. Span gas quality had a significant effect on emissions test results. The Spindt method was used in the piston aircraft emissions program. The Spindt method provided a comparative computational procedure for fuel/air ratio based on measured emissions concentrations.

THE EFFECT OF VARIATIONS IN CONTROLS AND DISPLAYS ON HELICOPTER INSTRUMENT APPROACH CAPABILITY
Frank R Niessen, James R Kelly, John F Garren Jr, Kenneth R Yenni and Lee H Person. Washington, Feb 1977. 43 p refs.
(NASA-TN-D-8385, L-10982) Avail NTIS HC A03/MF A01 CSCL 01C

A flight investigation was conducted with a variable stability helicopter to determine the effects of variations in controls and displays on helicopter instrument approach capabilities. The baseline instrument approach task was a decelerating approach to a hover along a 6 deg glide slope. Pilot evaluations were obtained for both the constant speed part of the task and the deceleration and hover part of the task. The attitude stability augmentation system (SAS) was strongly preferred over the rate

SAS because the aircraft had a divergent pitch response. From a display variation standpoint it was not possible to decelerate to a hover in a consistent manner, regardless of the control system employed with situation information only. In particular, the deceleration and hover part of the task was unacceptable without flight director command information. Author

APPLICATION OF A MODIFIED COMPLEMENTARY FILTERING TECHNIQUE FOR INCREASED AIRCRAFT CONTROL SYSTEM FREQUENCY BANDWIDTH IN HIGH VIBRATION ENVIRONMENT
 John F Garren Jr, Frank R Niessen, Terence S Abbott, and Kenneth R Yenni Jan 1977 21 p refs
 (NASA-TM-X-74004) Avail NTIS HC A02/MF A01 CSCL 01D

A modified complementary filtering technique for estimating aircraft roll rate was developed and flown in a research helicopter to determine whether higher gains could be achieved. Use of this technique did, in fact, permit a substantial increase in system frequency bandwidth because, in comparison with first-order filtering, it reduced both noise amplification and control limit-cycle tendencies. For an elastic aircraft model, which can move in the wind tunnel with several degrees of freedom, the development and practical test of a multivariable controller is discussed. The controller stabilizes the elevation and the pitch angle, alleviates vertical gusts and improves the damping of the first elastic mode. The control system synthesis depends on principles of optimization and simulation in the state space. Some low order linear filters are needed to meet the technical conditions. Author (ESA)

High-performance aircraft are susceptible to degraded flying qualities during maneuvering flight for a number of reasons, including aerodynamic nonlinearities, inertial coupling and rapidly

changing flight conditions. Lateral-directional modes of motion coupled with longitudinal motions in asymmetric flight and high angle of attack can lead to instability and adverse control response. The pilot must adapt his control strategies to varying aircraft dynamics and his work load is high, consequently improper piloting procedures could occur, leading to inadvertent loss of control. GRA

The report presents a program for the development of the fundamental technology for the assessment of the electromagnetic compatibility (EMC) effects of the use of advanced composite materials in aircraft. A survey of the electromagnetic impact of the use of advanced composite materials in aircraft is given. Electromagnetic hazards (lightning, nuclear blast EMP, precipitation static and radar) are described and related to the shielding performance of advanced composite materials. In addition, the effects of composite materials on antenna performance is discussed. The measurement of basic electrical properties and the definition and measurement of shielding effectiveness is treated in detail. Finally, and most importantly, future study tasks are defined which aim to develop electromagnetic environment analysis capability for existing and future aircraft systems using advanced composite materials. EVALUATION OF ISOTHERMAL FORGINGS FOR T53 IMPELLERS Final Technical Report, 16 Jun - 16 Dec 1976
 Elizabeth K Knauf and Louis J Fiedler Watertown Mass AMMRC 16 Dec 1975 51 p refs
 (Contract DAAG46-75-C-0078)
 (AD-A030469 USAAVSCOM-R-76-21, AMMRC-CTR-76-14) Avail NTIS HC A04/MF A01 CSCL 21/5

The primary objective of this program was to evaluate isothermal forgings of Ti-6Al-4V alloy in the form of near-net shaped T53 impellers and determine their potential technical and economic advantages over conventional forgings. An evaluation of mechanical properties showed the isothermal forging properties to meet current forging specifications. Finish machining of one forging was conducted using the current production process. This revealed a time saving of 2.1 standard hours over the conventional forging, a savings primarily in rough machining. Partially formed vanes are not realized as an advantage by the current milling process due to the cam controlled action of the cutter in the existing machining facility, i.e. several Gorton milling

machines. A cost analysis of alternative vane milling methods, i.e. numerical and/or adaptive control, has led to the conclusion that a process modification would not be cost effective due to current high efficiency of the Gorton mill. It is therefore recommended that a partial vane contour be included in the forged shape only to the extent that is effective in reducing input material cost without increasing forging costs.

RECON 6 A REAL-TIME, WIDE-ANGLE, SOLID-STATE RECONNAISSANCE CAMERA SYSTEM FOR HIGH-SPEED, LOW-ALTITUDE AIRCRAFT

Richard L Labinger In JPL Conf on Charge-Coupled Device Technol and Appls 1976 p 129-134

Avail NTIS HC A11/MF A01 CSCL 14E

The maturity of self-scanned solid-state multielement photosensors makes the realization of 'real time' reconnaissance photography viable and practical. A system built around these sensors which can be constructed to satisfy the requirements of the tactical reconnaissance scenario is described. The concept chosen is the push broom strip camera system -- RECON 6 -- which represents the least complex and most economical approach for an electronic camera capable of providing a high level of performance over a 140 deg wide continuous swath at altitudes from 200 to 3,000 feet and at minimum loss in resolution at higher altitudes.

(NASA-CR-151952) Avail NTIS HC A05/MF A01 CSCL 09C

The criteria of the significant value of the panel instruments used in general aviation were examined and kinematic equations were added for comparison. An instrument survey was performed to establish the present state of the art in linear and angular accelerometers, pressure transducers, and magnetometers. A very preliminary evaluation was done of the computers available for data evaluation and estimator mechanization. The mathematical model of a light twin aircraft employed in the evaluation was documented, the results of the sensor survey and the results of the design studies were presented.

STUDY AND DESIGN OF FLIGHT DATA RECORDING SYSTEMS FOR MILITARY AIRCRAFT M S Thesis

Lloyd Norman Baetz Jun 1976 129 p refs

(AD-A028862) Avail NTIS HC A07/MF A01 CSCL 01/2

Investigation of aircraft wreckage does not provide crash investigators with adequate information. Crash-protected flight recorder data is invaluable when determining accident cause factors. Inertial navigation systems provide an excellent source of highly accurate flight parameters. Nonvolatile solid state memory is available which can replace failure prone magnetic tape recording in flight recorder systems. Microprocessors are available with the capability of compressing flight data for solid state memory storage. Data compression trials indicate that a flight data recording system using microcomputer preprocessing and nonvolatile solid state memory is feasible.

A COMPARISON OF A LABORATORY AND FIELD STUDY

OF ANNOYANCE AND ACCEPTABILITY OF AIRCRAFT NOISE EXPOSURES

Paul N Borsky Washington NASA Feb 1977 73 p refs (Grant NsG-1164)

(NASA-CR-2772) Avail NTIS HC A04/MF A01 CSCL 20A

Residents living in close, middle and distant areas from JFK Airport were included in a field interview and laboratory study. Judgments were made of simulated aircraft noise exposures of comparable community indoor noise levels and mixes of aircraft. Each group of subjects judged the levels of noise typical for its distance area. Four different numbers of flyovers were tested less than average for each area, the approximate average, the peak number, or worst day and above peak number. The major findings are: (1) the reported integrated field annoyance is best related to the annoyance reported for the simulated approximate worst day exposure in the laboratory; (2) annoyance is generally less when there are fewer aircraft flyovers, and the subject has less fear of crashes and more favorable attitudes toward airplanes; (3) beliefs in harmful health effects and misfeasance by operators of aircraft are also highly correlated with fear and noise annoyance; (4) in direct retrospective comparisons of number of flights, noise levels and annoyance, subjects more often said the worst day laboratory exposure more like their usual home environments; and (5) subjects do not expect an annoyance-free environment. Half of the subjects can accept an annoyance level of 5 to 6 from a possible annoyance range of 0 to 9, 28% can live with an annoyance intensity of 7 and only 5% can accept the top scores of 8 to 9.

AERODYNAMIC STABILITY

Stability derivative measurements with magnetically suspended cone-cylinder models
[NASA PAPER 77-79] A77-19813

Fifty years later - The new Helicostat --- rotary wing propelled airships A77-20025

Some recent developments in unsteady aerodynamics of a supersonic cascade A77-20138

Dynamics of a slung load A77-20440

Flight characteristics studies related to the employment of direct power steering in longitudinal motion
[DGLR PAPER 76-238] A77-21881

Integration of the 3-D harmonic kernel
[AD-A029550] N77-17015

Hingeless helicopter rotor with improved stability
[NASA-CASE-ARC-10807-1] N77-17029

A new method for test and analysis of dynamic stability and control
[AD-A029039] N77-17107

AERODYNAMIC STALLING

Comparison between theoretical and experimental results of torsional stall flutter of an airfoil A77-20140

Stall flutter and nonlinear divergence of a two-dimensional flat plate wing A77-20146

Analysis of the development of dynamic stall based on oscillating airfoil experiments
[NASA-TN-D-8382] N77-16999

AERODYNAMICS

Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight
[AIAA PAPER 77-5] A77-19766

Flow instability in supersonic compressors in the regime of low compression rate
[ONERA, TP NO. 1976-71] A77-20151

The principles of aerodynamics --- Russian book A77-22449

AEROELASTICITY

Symposium on Aeroelasticity in Turbomachines, Ecole Nationale Supérieure de Techniques Avancées, Paris, France, October 18-23, 1976, Proceedings A77-20129

Preliminary reflections on the problems of aeroelasticity in turbomachines A77-20131

Investigation of blade flutter in a subsonic turbine cascade A77-20142

Unsteady aerodynamic forces in a rectilinear cascade of subsonic blades

ATTITUDE (INCLINATION)

SUBJECT INDEX

ATTITUDE (INCLINATION)

Application of the Global Positioning System as an attitude reference for near-earth users A77-20675

ATTITUDE CONTROL

Attitude control of a pilotless aircraft by radioactive probes
[ONERA, TP NO. 1976-112] A77-20867

ATTITUDE INDICATORS

An Extended range Sensor Package (ESP)
[AD-A027850] N77-17025

AUTOMATIC CONTROL

An automatic-control air-jet-propelled ACV A77-20724

AUTOMATIC FLIGHT CONTROL

Automatic flight inspection of radio navigation facilities A77-20669

Realization problems concerning reliable CCV flight guidance systems
[DGLR PAPER 76-243] A77-21878

AUTOMATIC PILOTS

Head-up piloting aids
[NASA-TT-F-17389] N77-17057

AUTOMATION

Automated Terminal Service --- for airport tower installation A77-20668

AUTOMOBILE ENGINES

Application of automobile emission control technology to light piston aircraft engines N77-17083

AUXILIARY POWER SOURCES

High speed hydraulic starter motor for aircraft auxiliary power unit
[AD-A027413] N77-16065

AVIONICS

An avionics design philosophy for a Canadian coastal patrol aircraft A77-19650

Remotely piloted vehicles - The influence of system thinking on applied technology A77-20622

Processor system configuration in the NOE helicopter environment --- Nap-Of-the-Earth A77-20690

General aviation accidents involving aerobatics, 1972 - 1974
[PB-257747/6] N77-17020

AXISYMMETRIC BODIES

Numerical solution of axisymmetric boattail flow fields with plume simulators
[AIAA PAPER 77-224] A77-19909

Prediction of pressure distributions on axisymmetric bodies in transonic flow
[AIAA PAPER 77-226] A77-22248

B

B-1 AIRCRAFT

B-1 flight test progress report no. 2 A77-22004

BALLISTIC RANGES

Investigation of the size of the wake of a cone flying at hypersonic speed A77-19746

BANDPASS FILTERS

Application of a modified complementary filtering technique for increased aircraft control system frequency bandwidth in high vibration environment
[NASA-TM-X-74004] N77-17103

BANDWIDTH

Application of a modified complementary filtering technique for increased aircraft control system frequency bandwidth in high vibration environment
[NASA-TM-X-74004] N77-17103

BASE PRESSURE

Calculation of base pressure in ejector nozzles of different length for the case of a zero ejection coefficient A77-19747

BAYES THEOREM

Aircraft identification by moment invariants A77-21683

BEAMS (SUPPORTS)

Prediction of the angular vibration of aircraft structures A77-19977

BEARINGS

Teflon airframe bearings - Their advantages and limitations A77-22146

BENDING VIBRATION

Experimental and theoretical investigations of the aerodynamic damping of turbojet rotor blade vibrations A77-20141

BLADE TIPS

Effects of tip clearance on overall performance of transonic fan stage with and without casing treatment
[NASA-TM-X-3479] N77-16992

BLOWING

Efficiency of tangential boundary layer blowing in conical diffusers A77-19710

Application of boundary layer blowing to suppress strong shock induced separation in supersonic inlets
[AIAA PAPER 77-147] A77-22235

BLUNT BODIES

Investigation of supersonic flow past elongated blunt bodies of elliptical cross section A77-19744

Investigation of the size of the wake of a cone flying at hypersonic speed A77-19746

Calculation of supersonic laminar flow about a blunt body and the flow in the wake A77-22934

BOATS

The Mini Boat - A life boat for helicopter crewmen
[ASNE PAPER 76-ENAS-61] A77-19502

BOATTAILS

Reynolds number and nozzle afterbody configuration effects on model forebody and afterbody drag
[AIAA PAPER 77-103] A77-19827

Analytical study of viscous effects on transonic flow over boattail nozzles
[AIAA PAPER 77-223] A77-19908

Numerical solution of axisymmetric boattail flow fields with plume simulators
[AIAA PAPER 77-224] A77-19909

BODY-WING CONFIGURATIONS

Supersonic pressure measurements and comparison of theory to experiment for an arrow-wing configuration
[NASA-CR-145046] N77-17000

BOEING AIRCRAFT

Aerodynamic design --- future aircraft design factors A77-20716

BOEING 747 AIRCRAFT

Shaping the flight behavior of the 747SP A77-21320

BOMBER AIRCRAFT

F-18 multi-mission aircraft A77-22005

BOUNDARY LAYER CONTROL

Efficiency of tangential boundary layer blowing in conical diffusers A77-19710

Development of technology for the fabrication of reliable laminar flow control panels on subsonic transports
[NASA-CR-145125] N77-17038

BOUNDARY LAYER FLOW

Three-dimensional turbulent boundary layer calculations for swept wings
[AIAA PAPER 77-3] A77-19765

Computation of low speed flow about an asymmetric nacelle at incidence
[AIAA PAPER 77-143] A77-19857

Analytical study of viscous effects on transonic flow over boattail nozzles
[AIAA PAPER 77-223] A77-19908

Applied gasdynamics /4th revised edition/ --- Russian book A77-20123

BOUNDARY LAYER SEPARATION

Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[AIAA PAPER 77-144] A77-19983

- Application of boundary layer blowing to suppress strong shock induced separation in supersonic inlets
[AIAA PAPER 77-147] A77-22235
- Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[NASA-TM-X-73575] N77-17063
- BOUNDARY LAYER TRANSITION**
Boundary layer transition flight test observations --- for reentry vehicles
[AIAA PAPER 77-125] A77-22231
- BOUNDARY LUBRICATION**
Aircraft propulsion lubricating film additives: Boundary lubricant surface films, volume 3
[AD-A029267] N77-16356
- BOUNDARY VALUE PROBLEMS**
A numerical method for the exact calculation of airloads associated with impulsively started wings
[AIAA PAPER 77-2] A77-19764
- BRAKING**
Application of dimensional analysis to predict airplane stopping distance
A77-20446
- BUCKLING**
Deutsche Gesellschaft fuer Luft- und Raumfahrt, Shell Buckling Meeting, Meersburg, West Germany, April 29, 30, 1976, Reports and Discussion Contributions
A77-20573
- C**
- C-15 AIRCRAFT**
YC-15 development and test highlights
A77-22003
- C-135 AIRCRAFT**
GIANT CHANGE final report, KC-135 dual INS test
[AD-A028788] N77-17027
- Design and analysis of winglets for military aircraft
[AD-A029345] N77-17040
- C-141 AIRCRAFT**
Design and analysis of winglets for military aircraft
[AD-A029345] N77-17040
- CANARD CONFIGURATIONS**
Development of a small high-aspect-ratio canard aircraft
A77-22009
- A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations
[AIAA PAPER 77-1] A77-22205
- CARBON FIBER REINFORCED PLASTICS**
Carbon fibre reinforced plastic sandwich beam construction in the main wing structure of a man powered aircraft
[BU-197] N77-17039
- CASCADE FLOW**
Flow in turbomachines with nonuniform inlet velocity distribution
A77-19708
- Some recent developments in unsteady aerodynamics of a supersonic cascade
A77-20138
- On the analysis of the aerodynamic and flutter characteristics of transonic compressor blades
A77-20139
- Comparison between theoretical and experimental results of torsional stall flutter of an airfoil
A77-20140
- Unsteady aerodynamic forces in a rectilinear cascade of subsonic blades
[ONERA, TP NO. 1976-78] A77-20143
- Unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow
A77-20144
- An experiment to measure moment coefficients for aerofoils oscillating in cascade
A77-20145
- Experimental aeroelastic investigations on a cascade in compressible flow
A77-20147
- A study on choking flutter
A77-20148
- Vortex streets in the wakes of subsonic and transonic turbine cascades
A77-20154
- CAST ALLOYS**
Fatigue of gas-turbine blades made of heat-resistant casting alloys
A77-22266
- CENTRIFUGAL PUMPS**
Development of a retractable vane starting pump integrated within a vapor core fuel pump. Turbine engine technology demonstrator component development program, project 668A. Controls development program (part 5)
[AD-A029032] N77-17076
- CERTIFICATION**
Noise certification considerations for helicopters based on laboratory investigations
[AD-A032028/3] N77-16865
- CESSNA AIRCRAFT**
Flight test summary of modified fuel systems
N77-17090
- CHANNEL FLOW**
Flow in turbomachines with nonuniform inlet velocity distribution
A77-19708
- CHEMICAL ANALYSIS**
Evaluated numerical data for the SST and chlorofluorocarbon problems: A case study of how to help the engineer and the modellers
N77-16942
- CHLORINE COMPOUNDS**
Evaluated numerical data for the SST and chlorofluorocarbon problems: A case study of how to help the engineer and the modellers
N77-16942
- CIVIL AVIATION**
The R.P.V. in perspective
A77-20621
- A proposition for an advanced aircraft navigation system for civil air transport
A77-20667
- Data base for predicting noise from civil aircraft: Flight profile prediction
[PB-257638/7] N77-16867
- CLEARANCES**
Effects of tip clearance on overall performance of transonic fan stage with and without casing treatment
[NASA-TM-X-3479] N77-16992
- CLIMBING FLIGHT**
Optimal control of thrust and angle of attack of an aircraft performing a climb-acceleration maneuver

N77-16052
- An investigation of cockpit lighting for compatibility with use of night-vision goggles, AN/PVS-5
[AD-A029212] N77-17046
- COEFFICIENT OF FRICTION**
The employment of aircraft on operational areas in the case of differing surface conditions
A77-22119
- COMBAT**
Estimation of weapon-radius versus maneuverability trade-off for air-to-air combat
[AIAA PAPER 77-35] A77-19787

Research on smart target for aerial combat. Part
1: General description
[AD-A029171] N77-17050

Research on smart target for aerial combat. Part
2: Technical description
[AD-A029172] N77-17051

Research on smart target for aerial combat. Part
3: Interface documentation
[AD-A029173] N77-17052

COMBUSTION CHAMBERS
Combustion modelling within gas turbine engines,
some applications and limitations
[AIAA PAPER 77-52] A77-19796

Pollutant formation in fuel lean recirculating flows
--- in an Opposed Reacting Jet Combustor
[NASA-CR-2785] N77-17069

COMBUSTION EFFICIENCY
Characteristic time correlation of emissions from
conventional aircraft type flames
[PB-258269/0] N77-17078

COMBUSTION PHYSICS
A general theory of turbulent combustion - The
Lagrangian aspects
[AIAA PAPER 77-141] A77-19855

COMMUNICATION EQUIPMENT
TRACALS evaluation report. Communications station
evaluation report, Kadena AB, Japan, 4 March -
16 March 1976
[AD-A029713] N77-17028

COMPONENT RELIABILITY
Aircraft environmental control problems as a
result of air contamination
[ASME PAPER 76-ENAS-13] A77-19464

A modular fail op fail safe strapped-down navigator
A77-20665

COMPOSITE MATERIALS
Composite hubs for low cost gas turbine engines
[NASA-TM-X-73578] N77-17066

A technology plan for electromagnetic
characteristics of advanced composites
[AD-A030507] N77-17175

COMPOSITE STRUCTURES
Advanced composites manufacturing as influenced by
design --- for A-7D aircraft outer wing panel
A77-22145

COMPRESSIBLE BOUNDARY LAYER
A general method for calculating three-dimensional
compressible laminar and turbulent boundary
layers on arbitrary wings
[NASA-CR-2777] N77-16994

COMPRESSIBLE FLOW
Experimental aeroelastic investigations on a
cascade in compressible flow
A77-20147

On the not-so-slender wing theory
A77-22679

COMPRESSOR BLADES
On the analysis of the aerodynamic and flutter
characteristics of transonic compressor blades
A77-20139

COMPRESSOR EFFICIENCY
Compressor critical response time determination
study
[AD-A028882] N77-17074

COMPUTER PROGRAMS
Three-dimensional turbulent boundary layer
calculations for swept wings
[AIAA PAPER 77-3] A77-19765

A brief description of the Jameson-Caughey NYU
transonic swept-wing computer program: FLO 22
[NASA-TM-X-73996] N77-15977

A simplified analysis of propulsion installation
losses for computerized aircraft design
[NASA-TM-X-73136] N77-16016

A new method for test and analysis of dynamic
stability and control
[AD-A029039] N77-17107

COMPUTER TECHNIQUES
Aircraft identification by moment invariants
A77-21683

COMPUTERIZED DESIGN
Review of the application of hodograph theory to
transonic aerofoil design and theoretical and
experimental analysis of shock-free aerofoils
--- noting pressure distributions
[NRL-MP-75033-U] N77-15991

A simplified analysis of propulsion installation
losses for computerized aircraft design
[NASA-TM-X-73136] N77-16016

COMPUTERIZED SIMULATION

Simulation analysis of a microcomputer-based,
low-cost omega navigation system A77-20674

REXOR rotorcraft simulation. Volume 3: User's
manual
[AD-A028417] N77-17054

CONFERENCES

Symposium on Aeroelasticity in Turbomachines,
Ecole Nationale Supérieure de Techniques
Avancées, Paris, France, October 18-23, 1976,
Proceedings A77-20129

Deutsche Gesellschaft fuer Luft- und Raumfahrt,
Shell Buckling Meeting, Meersburg, West Germany,
April 29, 30, 1976, Reports and Discussion
Contributions A77-20573

Symposium on the Presentation of Information to
Pilots, London, England, March 18, 1976,
Proceedings A77-20603

Inter-noise 76; Proceedings of the International
Conference on Noise Control Engineering,
Washington, D.C., April 5-7, 1976 A77-20629

New frontiers in aerospace navigation; Proceedings
of the Bicentennial National Aerospace
Symposium, Warminster, Pa., April 27, 28, 1976
A77-20655

Visual presentation of cockpit information
including special devices used for particular
conditions of flying
[AGARD-CP-201] N77-16050

Aircraft Piston Engine Exhaust Emission Symposium
[NASA-CP-2005] N77-17081

Summary of the general aviation manufacturers'
position on aircraft piston engine emissions
N77-17098

CONGRESSIONAL REPORTS

Aircraft fuel efficiency program
[S-REPT-94-633] N77-17032

CONICAL BODIES

Investigation of supersonic flow past elongated
blunt bodies of elliptical cross section
A77-19744

CONICAL NOZZLES

Efficiency of tangential boundary layer blowing in
conical diffusers
A77-19710

CONTAMINANTS

Emissions data by category of engines
N77-17087

CONTAMINATION

Aircraft environmental control problems as a
result of air contamination
[ASME PAPER 76-ENAS-13] A77-19464

CONTRACTS

Introduction to NASA contracts --- on engine
modifications to reduce exhaust emissions
N77-17091

CONTROL

A new method for test and analysis of dynamic
stability and control
[AD-A029039] N77-17107

CONTROL CONFIGURED VEHICLES

An analytical method for ride quality of flexible
airplanes
A77-20080

CCVs - Active control technology creating new
military aircraft design potential
A77-21755

Improvement of the structure-dynamical properties
of aircraft with CCV systems
[DGLR PAPER 76-237] A77-21876

Direct side force control - Possibilities and
problems of an application in the case of
fighter aircraft
[DGLR PAPER 76-239] A77-21877

Realization problems concerning reliable CCV
flight guidance systems
[DGLR PAPER 76-243] A77-21878

Possibilities and solution methods of CCV technology
[DGLR PAPER 76-236] A77-21879

Design criteria and characteristics of operational
CCV flight guidance systems
[DGLR PAPER 76-242] A77-21880

SUBJECT INDEX

DISPLAY DEVICES

Flight characteristics studies related to the employment of direct power steering in longitudinal motion [DGLR PAPER 76-238] A77-21881

Maneuver load control and gust load alleviation - Design and application possibilities [DGLR PAPER 76-240] A77-21882

Flight testing the fighter CCV A77-22007

CONTROL EQUIPMENT
Electrical flight control for Boeing YC-14 A77-20006

CONTROL SIMULATION
Shaping the flight behavior of the 747SP A77-21320

CONTROL SURFACES
Lifting surface theory for wings of arbitrary planform [AD-A028449] N77-16000
Application of active controls for the reduction of fatigue loads [NLR-TR-75163-U] N77-16070

CONTROLLABILITY
Handling quality criterion for heading control --- aileron-rudder sequencing for coordinated turns A77-20443

COOLING SYSTEMS
Cooling methods for aircraft electronics equipment [ASME PAPER 76-ENAS-51] A77-19492

CORES
Core noise measurements on a YF-102 turbofan engine [NASA-TN-X-73587] N77-17064

CORRELATION DETECTION
Correlation velocity sensor --- aircraft navigation instrument A77-20670

COST ANALYSIS
Energy considerations in aeronautical transportation /The W. Rupert Turnbull Lecture/ A77-19649

COST EFFECTIVENESS
Identification of critical failures and cost effective reliability improvement approaches [AD-A028333] N77-17022

COST REDUCTION
Design of military aircraft for minimum cost of ownership A77-22756

COUPLINGS
Preproduction test program, Kaflex drive shaft coupling for UH-1 helicopter, phases 8, 9 and 10 [AD-A028202] N77-17044

CRITICAL EXPERIMENTS
Compressor critical response time determination study [AD-A028882] N77-17074

CROSS COUPLING
On aerodynamic coupling between lateral and longitudinal degrees of freedom --- for military flight conditions [AIAA PAPER 77-4] A77-22206

CRUISING FLIGHT
Lift/cruise fan V/STOL technology aircraft design definition study. Volume 2: Propulsion transmission system design [NASA-CR-151932] N77-16014

CURVATURE
Nonlinear curvature expressions for combined flapwise bending, chordwise bending, torsion and extension of twisted rotor blades [NASA-TN-X-73997] N77-16376

CYLINDRICAL BODIES
Stability derivative measurements with magnetically suspended cone-cylinder models [AIAA PAPER 77-79] A77-19813

D

DAMPING
Dual INS velocity error reduction through new damping techniques A77-20678

DATA ACQUISITION
A flight instrumentation system for acquisition of atmospheric turbulence data [NASA-TN-D-8314] N77-16048

DATA BASES
Data base for predicting noise from civil aircraft: Flight profile prediction [PB-257638/7] N77-16867

DATA LINKS
Communications with aircraft via satellite A77-21423

DATA REDUCTION
Emissions data by category of engines N77-17087
Teledyne Continental Motors emissions data and analysis and flight test results N77-17089

DATA STORAGE
Study and design of flight data recording systems for military aircraft --- Microprocessing flight data for solid state memory storage [AD-A029862] N77-17446

DATA SYSTEMS
Evaluated numerical data for the SST and chlorofluorocarbon problems: A case study of how to help the engineer and the modellers N77-16942

DEAD RECKONING
Evaluation of the accuracy of community relative navigation organization concepts A77-20656

DECAY RATES
Vortex interactions and decay in aircraft wakes A77-22678

DECISION THEORY
Regulation of the air traffic control system A77-21593

DELTA WINGS
Effect of a conical break in delta wings on aerodynamic characteristics A77-19733
A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations [AIAA PAPER 77-1] A77-22205
Nonlinear, unsteady aerodynamic loads on rectangular and delta wings [AIAA PAPER 77-156] A77-22238
Investigation of the steady-state behavior of two delta-wing hang gliders [NASA-TT-F-17394] N77-17031

DIELECTRICS
High voltage design guide for airborne equipment [AD-A029268] N77-16272

DIFFUSERS
Efficiency of tangential boundary layer blowing in conical diffusers A77-19710

DIGITAL SYSTEMS
Realization problems concerning reliable CCV flight guidance systems [DGLR PAPER 76-243] A77-21878

DIMENSIONAL ANALYSIS
Application of dimensional analysis to predict airplane stopping distance A77-20446

DIRECTIONAL STABILITY
An automatic-control air-jet-propelled ACV A77-20724

DISCHARGE COEFFICIENT
Experimental investigation of the characteristics of small-dimensioned nozzles A77-19739

DISCONNECT DEVICES
Flight test development of a helicopter-towed surface delivery [AD-A028637] N77-17042

DISPLAY DEVICES
Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings A77-20603
Flight information for airline pilots - The certification angle A77-20605
Investigation into the optimum use of advanced displays in future transport aircraft A77-20606
Presenting information to the general aviation pilot A77-20608
Operational requirements for advanced fighter aircrew displays A77-22728

DISTANCE MEASURING EQUIPMENT

SUBJECT INDEX

Cockpit information requirements - Common elements
A77-22729

The maneuvering flight path display
A77-22730

Evaluating the characteristics of luminous colored cockpit displays
A77-22736

Integrated color display system --- for aircraft
A77-22737

Tactical air applications for advanced multisensor imagery processing and display techniques
A77-22738

Visual presentation of cockpit information including special devices used for particular conditions of flying
[AGARD-CP-201]
N77-16050

The development of aircraft instruments
N77-16051

Evaluation of cockpit lighting
N77-16052

Comparative experimental evaluation of two-dimensional and pseudo-perspective displays for guidance and control
N77-16053

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results
[AD-A029051]
N77-16071

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 2: Background information and supporting data
[AD-A028874]
N77-16072

DISTANCE MEASURING EQUIPMENT

Precision DME for future landing systems - One solution
A77-21421

DRAG REDUCTION

Fluctuating pressure environment of a drag reduction spike
[AIAA PAPER 77-90]
A77-19819

On some structure-turbulence interaction problems
[NASA-CR-149461]
N77-15986

DUCTED FAN ENGINES

The Aerodyne - An R.P.V. with multiple capability
A77-20626

DUCTED FANS

Skyspy - A ducted RPV fan
A77-20627

Aerodynamic and acoustic tests of duct-burning turbofan exhaust nozzles
[NASA-CR-2628]
N77-16986

DUCTED FLOW

Influence of fuel temperature on supersonic mixing and combustion of hydrogen
[AIAA PAPER 77-17]
A77-19778

DYNAMIC PRESSURE

Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113]
A77-22228

DYNAMIC STRUCTURAL ANALYSIS

Prediction of the angular vibration of aircraft structures
A77-19977

Improvement of the structure-dynamical properties of aircraft with CCV systems
[DGLR PAPER 76-237]
A77-21876

Carbon fibre reinforced plastic sandwich beam construction in the main wing structure of a man powered aircraft
[BU-197]
N77-17039

E

EARTH ROTATION

The new UTC Time Signals --- Coordinated Universal Time
A77-20658

EFFICIENCY

Theoretical parametric study of the relative advantages of winglets and wing-tip extensions
[NASA-TM-X-74003]
N77-16989

EJECTORS

Calculation of base pressure in ejector nozzles of different length for the case of a zero ejection coefficient
A77-19747

ELECTRIC CONTROL

Electrical flight control for Boeing YC-14
A77-20006

ELECTRICAL INSULATION

High voltage design guide for airborne equipment
[AD-A029268]
N77-16272

ELECTROMAGNETIC SCATTERING

Half-plane scattering applied to ILS grading criteria
A77-21951

ELECTROMAGNETIC SHIELDING

A technology plan for electromagnetic characteristics of advanced composites
[AD-A030507]
N77-17175

ELECTRONIC EQUIPMENT

Cooling methods for aircraft electronics equipment
[ASME PAPER 76-ENAS-51]
A77-19492

ENCLOSURES

Effects of tip clearance on overall performance of transonic fan stage with and without casing treatment
[NASA-TM-X-3479]
N77-16992

ENERGY CONSERVATION

Energy considerations in aeronautical transportation /The W. Rupert Turnbull Lecture/
A77-19649

ENERGY POLICY

Aircraft fuel efficiency program
[S-REPT-94-633]
N77-17032

ENGINE DESIGN

Combustion modelling within gas turbine engines, some applications and limitations
[AIAA PAPER 77-52]
A77-19796

Flap noise and aerodynamic results for model QCSE over-the-wing configurations --- Quiet Clean Short-haul Experimental Engine program
[AIAA PAPER 77-23]
A77-19982

Development of materials used in gas turbine engines - R and D guide lines and proposals for a priority scheme
A77-22166

Gas turbine emission control - A systems approach
A77-22181

Alternative general-aircraft engines
N77-17097

ENGINE INLETS

Transonic performance of an auxiliary airflow system for axisymmetric inlets
[AIAA PAPER 77-148]
A77-19960

Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[AIAA PAPER 77-144]
A77-19983

Survey of inlet noise reduction concepts for gas turbine engines
A77-20634

ENGINE NOISE

Core noise measurements on a YF-102 turbofan engine
[AIAA PAPER 77-21]
A77-19981

Survey of inlet noise reduction concepts for gas turbine engines
A77-20634

Testing equipment available in France for studying aircraft and engine noise
A77-21887

Techniques employed in analyzing turbojet noise
A77-21893

The transmission of acoustic plane-waves at a jet exhaust
[AIAA PAPER 77-22]
A77-22207

The 727/JT8D jet and fan noise flight effects study
[AD-A031877/4]
N77-16063

Core noise measurements on a YF-102 turbofan engine
[NASA-TM-X-73587]
N77-17064

Theoretical and experimental investigation of noise shielding for jet engines --- acoustic and aerodynamic interference measurements
[BMFT-FB-W-6-09]
N77-17072

ENGINE STARTERS

Starting systems for aircraft gas turbine engines --- Russian book
A77-20122

High speed hydraulic starter motor for aircraft auxiliary power unit
[AD-A027413]
N77-16065

SUBJECT INDEX

FIGHTER AIRCRAFT

ENGINE TESTS

- Core noise measurements on a YF-102 turbofan engine
[AIAA PAPER 77-21] A77-19981
- Vibration tests on aircraft engines A77-22260
- Review of measurement and testing problems --- of
aircraft emissions N77-17099
- Review of measurement and testing problems N77-17100

ENVIRONMENT EFFECTS

- Cooling methods for aircraft electronics equipment
[ASME PAPER 76-ENAS-51] A77-19492

ENVIRONMENTAL CONTROL

- Aircraft environmental control problems as a
result of air contamination A77-19464
- [ASME PAPER 76-ENAS-13]
- Fluidic applications to aircraft environmental
control systems A77-19471
- [ASME PAPER 76-ENAS-21]

EQUATIONS OF MOTION

- Helicopter motion - Equation linearization A77-20260

ERROR ANALYSIS

- Error model of an inertial navigation system for
integrated navigation based on adjustment
according to the method of least squares A77-20652

EUROPEAN AIRBUS

- A wing for the Airbus A77-22662

EUROPEAN SPACE PROGRAMS

- Fokker-VFW --- Netherlands space projects A77-20377

EVASIVE ACTIONS

- Estimation of weapon-radius versus maneuverability
trade-off for air-to-air combat A77-19787
- [AIAA PAPER 77-35]

EXHAUST DIFFUSERS

- Variable-area subsonic diffuser study
[AD-A029352] N77-16067

EXHAUST FLOW SIMULATION

- Scramjet exhaust simulation technique for
hypersonic aircraft nozzle design and
aerodynamic tests A77-19815
- [AIAA PAPER 77-82]
- An evaluation of jet simulation parameters for
nozzle/afterbody testing at transonic Mach numbers
[AIAA PAPER 77-106] A77-19830

EXHAUST GASES

- An experimental and numerical study of the 3-D
mixing flows of a turbofan engine exhaust system
[AIAA PAPER 77-204] A77-19896
- Gas turbine emission control - A systems approach
A77-22181

- Ambient temperature and humidity correction
factors for exhaust emissions from two classes
of aircraft turbine engines
[AD-A031923/6] N77-16064

- Aircraft Piston Engine Exhaust Emission Symposium
[NASA-CP-2005] N77-17081

- Development of EPA aircraft piston engine emission
standards --- for air quality N77-17082

- Emissions data by category of engines N77-17087

- Avco Lycoming emission and flight test results
N77-17088

- Teledyne Continental Motors emissions data and
analysis and flight test results N77-17089

- Introduction to NASA contracts --- on engine
modifications to reduce exhaust emissions N77-17091

- TCM aircraft piston engine emission reduction
program N77-17092

- Emissions and new technology programs for
conventional spark-ignition aircraft engines
N77-17096

- Summary of the general aviation manufacturers'
position on aircraft piston engine emissions
N77-17098

- Review of measurement and testing problems --- of
aircraft emissions N77-17099

- Review of measurement and testing problems
N77-17100

EXHAUST NOZZLES

- Aerodynamic and acoustic tests of duct-burning
turbofan exhaust nozzles
[NASA-CR-2628] N77-16986

EXPERIMENTAL DESIGN

- Comparative experimental evaluation of
two-dimensional and pseudo-perspective displays
for guidance and control N77-16053

EXTERNAL STORES

- Comparison of two methods used to measure
aerodynamic loads acting on captive store models
in wind tunnel tests
[AD-A030208] N77-17016
- Investigation of larger than A size dimensional
configurations --- for determining dimensions of
external stores p-3 aircraft
[AD-A029024] N77-17043

F

F-4 AIRCRAFT

- Comparison of two methods used to measure
aerodynamic loads acting on captive store models
in wind tunnel tests
[AD-A030208] N77-17016
- Research on smart target for aerial combat. Part
1: General description N77-17050
- [AD-A029171]
- Research on smart target for aerial combat. Part
2: Technical description N77-17051
- [AD-A029172]
- Research on smart target for aerial combat. Part
3: Interface documentation N77-17052
- [AD-A029173]

F-5 AIRCRAFT

- F-5E spin susceptibility test A77-22006

F-18 AIRCRAFT

- F-18 multi-mission aircraft A77-22005

F-102 AIRCRAFT

- Core noise measurements on a YF-102 turbofan engine
[NASA-TM-X-73587] N77-17064

FAIL-SAFE SYSTEMS

- A modular fail op fail safe strapped-down navigator
A77-20665
- Realization problems concerning reliable CCV
flight guidance systems
[DGLR PAPER 76-243] A77-21878

FAILURE MODES

- Identification of critical failures and cost
effective reliability improvement approaches
[AD-A028333] N77-17022

FAR FIELDS

- A theoretical investigation of laminar wakes
behind airfoils and the resulting noise pattern
A77-22045

FATIGUE LIFE

- The scatter factor in the reliability assessment
of aircraft structures A77-20445

- Application of active controls for the reduction
of fatigue loads
[NLR-TR-75163-U] N77-16970

FATIGUE TESTS

- Fatigue of gas-turbine blades made of
heat-resistant casting alloys A77-22266

FEEDBACK CONTROL

- Dual INS velocity error reduction through new
damping techniques A77-20678

FIGHTER AIRCRAFT

- Direct side force control - Possibilities and
problems of an application in the case of
fighter aircraft
[DGLR PAPER 76-239] A77-21877

- Operational requirements for advanced fighter
aircrew displays A77-22728

- The maneuvering flight path display
A77-22730

- Jet exhaust and support interference effects on
the transonic aerodynamic characteristics of a
fighter model with two widely spaced engines
[NASA-TM-X-3424] N77-15978

FILM COOLING

SUBJECT INDEX

FILM COOLING

Thermo-mechanical stress analysis of advanced turbine blade cooling configuration [AD-A027718] N77-16066

FINITE DIFFERENCE THEORY

Three-dimensional turbulent boundary layer calculations for swept wings [AIAA PAPER 77-3] A77-19765

Advanced techniques for computation of supersonic flow [AIAA PAPER 77-173] A77-19874

Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions [AIAA PAPER 77-205] A77-19897

Calculation of transonic wing flows by grid embedding [AIAA PAPER 77-207] A77-19899

Numerical solution of axisymmetric boattail flow fields with plume simulators [AIAA PAPER 77-224] A77-19909

Remarks on the suitability of various transonic small perturbation equations to describe three-dimensional transonic flow; examples of computations using a fully-conservative rotated difference scheme --- three typical shock interactions [NLR-MP-75039-U] N77-15992

FIRE EXTINGUISHERS

Evaluation of Halon 1301 system for postcrash aircraft internal cabin fire protection [AD-A032150/5] N77-16003

FIXED WINGS

B.A.C. experience with small fixed wing and rotary wing R.P.Vs A77-20628

FLAPS (CONTROL SURFACES)

An experimental investigation of airframe component interference noise [AIAA PAPER 77-56] A77-19800

FLAT PLATES

Incipient separation of leeward flow past a lifting plate in viscous hypersonic flow A77-20095

Stall flutter and nonlinear divergence of a two-dimensional flat plate wing A77-20146

FLEXIBLE BODIES

An analytical method for ride quality of flexible airplanes A77-20080

FLEXIBLE WINGS

Investigation of the steady-state behavior of two delta-wing hang gliders [NASA-TT-F-17394] N77-17031

FLIGHT CHARACTERISTICS

Helicopter motion - Equation linearization A77-20260

Flight characteristics studies related to the employment of direct power steering in longitudinal motion [DGLR PAPER 76-238] A77-21881

YC-14 flight test progress report A77-22002

B-1 flight test progress report no. 2 A77-22004

F-5E spin susceptibility test A77-22006

Flight testing the fighter CCV A77-22007

Jet noise source modification due to forward flight [AIAA PAPER 77-58] A77-22215

The principles of aerodynamics --- Russian book A77-22449

FLIGHT CONTROL

Electrical flight control for Boeing YC-14 A77-20006

CCVs - Active control technology creating new military aircraft design potential A77-21755

Possibilities and solution methods of CCV technology [DGLR PAPER 76-236] A77-21879

Design criteria and characteristics of operational CCV flight guidance systems [DGLR PAPER 76-242] A77-21880

Maneuver load control and gust load alleviation - Design and application possibilities [DGLR PAPER 76-240] A77-21882

Operational problems of supersonic aircraft A77-22116

Application of active controls for the reduction of fatigue loads [NLR-TR-75163-U] N77-16070

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results [AD-A029051] N77-16071

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 2: Background information and supporting data [AD-A028874] N77-16072

An Extended range Sensor Package (ESP) [AD-A027850] N77-17025

Transport airplane flight deck development survey and analysis: Report and recommendations [NASA-CR-145121] N77-17030

Operational requirements for flight control and navigation systems for short haul transport aircraft [NASA-CR-137975] N77-17034

The effect of variations in controls and displays on helicopter instrument approach capability [NASA-TN-D-8385] N77-17102

Compass cope flight control system redundancy study [AD-A029021] N77-17105

High angle of attack of stability and control [AD-A027877] N77-17106

FLIGHT CREWS

The Mini Boat - A life boat for helicopter crewmen [ASME PAPER 76-ENAS-61] A77-19502

FLIGHT INSTRUMENTS

A flight instrumentation system for acquisition of atmospheric turbulence data [NASA-TN-D-8314] N77-16048

The development of aircraft instruments N77-16051

Transport airplane flight deck development survey and analysis: Report and recommendations [NASA-CR-145121] N77-17030

Head-up piloting aids [NASA-TT-F-17389] N77-17057

FLIGHT PATHS

The employment of the hybrid flight measurement system for measurements related to the study of a microwave landing system A77-20654

The maneuvering flight path display A77-22730

Data base for predicting noise from civil aircraft: Flight profile prediction [PB-257638/7] N77-16967

Operational requirements for flight control and navigation systems for short haul transport aircraft [NASA-CR-137975] N77-17034

FLIGHT RECORDERS

Study and design of flight data recording systems for military aircraft --- Microprocessing flight data for solid state memory storage [AD-A028862] N77-17446

FLIGHT SAFETY

Regulation of the air traffic control system A77-21593

Safety of transport aircraft [BMPT-PB-W-76-07] N77-17019

FLIGHT SIMULATORS

A launch transient experiment for imaging seekers [AD-A028625] N77-16049

Research on smart target for aerial combat. Part 3: Interface documentation [AD-A029173] N77-17052

FLIGHT TESTS

Methods and techniques of vibration testing in flight [ONERA, TP NO. 1976-120] A77-20868

Shaping the flight behavior of the 747SP A77-21320

YC-14 flight test progress report A77-22002

YC-15 development and test highlights A77-22003

B-1 flight test progress report no. 2 A77-22004

SUBJECT INDEX

FUEL FLOW

- F-5E spin susceptibility test A77-22006
- Flight testing the fighter CCV A77-22007
- Boundary layer transition flight test observations
--- for reentry vehicles A77-22231
[AIAA PAPER 77-125]
- Advancing blade concept /ABC/ development ---
XH-59A flight tests A77-22669
- Flight measurements of lifting pressures for a
thin low-aspect-ratio wing at subsonic,
transonic, and low supersonic speeds
[NASA-TN-X-3405] N77-16996
- GIANT CHANGE final report, KC-135 dual INS test
[AD-A028788] N77-17027
- Flight test development of a helicopter-towed
surface delivery N77-17042
[AD-A028637]
- Avco Lycoming emission and flight test results
N77-17088
- Teledyne Continental Motors emissions data and
analysis and flight test results N77-17089
- Flight test summary of modified fuel systems
N77-17090
- FLOW CHARACTERISTICS**
Flow in turbomachines with nonuniform inlet
velocity distribution A77-19708
- FLOW DISTORTION**
On the unsteady aerodynamic rotor blade loading in
a transonic axial flow compressor with
steady-state inlet distortion A77-20153
- Internal flow characteristics of a multistage
compressor with inlet pressure distortion ---
J85-13 turbojet engine studies
[NASA-TN-X-3446] N77-17070
- FLOW DISTRIBUTION**
Flow measurements in leading edge vortices
[AIAA PAPER 77-11] A77-19772
- Computation of low speed flow about an asymmetric
nacelle at incidence A77-19857
[AIAA PAPER 77-143]
- An approximate calculation of the strong
interaction on a transonic airfoil A77-19900
[AIAA PAPER 77-210]
- Numerical solution of axisymmetric boattail flow
fields with plume simulators A77-19909
[AIAA PAPER 77-224]
- Static aeroelastic twist effects on helicopter
rotor-induced velocity A77-20448
- Nacelle installation analysis for subsonic
transport aircraft A77-22227
[AIAA PAPER 77-102]
- FLOW EQUATIONS**
Investigations related to the inviscid-viscous
interaction in transonic flows about finite 3-D
wings A77-22244
[AIAA PAPER 77-209]
- FLOW MEASUREMENT**
Flow measurements in leading edge vortices
[AIAA PAPER 77-11] A77-19772
- Detailed measurements of the periodically unsteady
flow produced by rotor and stator wake
interaction in a multistage turbomachine
[AIAA PAPER 77-202] A77-19894
- FLOW STABILITY**
Flow instability in supersonic compressors in the
regime of low compression rate A77-20151
[ONERA, TP NO. 1976-71]
- FLOW VISUALIZATION**
A prescribed wake lifting surface hover
performance analysis A77-22670
- FLUID JETS**
Penetration and break-up of liquid fuel jets in
high subsonic speed airstreams A77-19893
[AIAA PAPER 77-201]
- FLUIDICS**
Fluidic applications to aircraft environmental
control systems A77-19471
[ASME PAPER 76-ENAS-21]
- FLUOROCARBONS**
Evaluated numerical data for the SST and
chlorofluorocarbon problems: A case study of
how to help the engineer and the modellers N77-16942
- FLUOROXYDROCARBONS**
Evaluation of Halon 1301 system for postcrash
aircraft internal cabin fire protection
[AD-A032150/5] N77-16003
- FLUTTER**
Preliminary reflections on the problems of
aeroelasticity in turbomachines A77-20131
- FLUTTER ANALYSIS**
Unsteady aerodynamic forces acting on loaded
two-dimensional blades in nonuniform
incompressible flows A77-20137
- Some recent developments in unsteady aerodynamics
of a supersonic cascade A77-20138
- On the analysis of the aerodynamic and flutter
characteristics of transonic compressor blades A77-20139
- Comparison between theoretical and experimental
results of torsional stall flutter of an airfoil A77-20140
- Investigation of blade flutter in a subsonic
turbine cascade A77-20142
- Stall flutter and nonlinear divergence of a
two-dimensional flat plate wing A77-20146
- Experimental aeroelastic investigations on a
cascade in compressible flow A77-20147
- A study on choking flutter A77-20148
- State-space formulations for flutter analysis
[AIAA PAPER 77-117] A77-22230
- FLY BY WIRE CONTROL**
Effects of artificial stability on configuration
design A77-20719
- Realization problems concerning reliable CCV
flight guidance systems A77-21878
[DGLR PAPER 76-243]
- FLYING PLATFORMS**
Flow measurements in leading edge vortices
[AIAA PAPER 77-11] A77-19772
- FOREBODIES**
A forebody design technique for highly integrated
bottom-mounted scramjets with application to a
hypersonic research airplane N77-16019
[NASA-TN-D-8369]
- FORGING**
Evaluation of isothermal forgings for T53 impellers
[AD-A030469] N77-17227
- FUEL COMBUSTION**
Influence of fuel temperature on supersonic mixing
and combustion of hydrogen A77-19778
[AIAA PAPER 77-17]
- Combustion modelling within gas turbine engines,
some applications and limitations A77-19796
[AIAA PAPER 77-52]
- FUEL CONSUMPTION**
Effects of artificial stability on configuration
design A77-20719
- Aircraft fuel efficiency program
[S-REPT-94-633] N77-17032
- FUEL CONTAMINATION**
Pollutant formation in fuel lean recirculating flows
--- in an Opposed Reacting Jet Combustor N77-17069
[NASA-CR-2785]
- FUEL CONTROL**
Flight test summary of modified fuel systems
N77-17090
- FUEL FLOW**
Penetration and break-up of liquid fuel jets in
high subsonic speed airstreams A77-19893
[AIAA PAPER 77-201]
- Review of measurement and testing problems --- of
aircraft emissions N77-17099

FUEL PUMPS

SUBJECT INDEX

FUEL PUMPS

- Development of a retractable vane starting pump integrated within a vapor core fuel pump. Turbine engine technology demonstrator component development program, project 668A. Controls development program (part 5) [AD-A029032] N77-17076
- FUEL SYSTEMS**
 - Teledyne Continental Motors emissions data and analysis and flight test results N77-17089
 - Flight test summary of modified fuel systems N77-17090
- FUEL TANKS**
 - The technical concept of the IL-62M. II - Fuel system A77-22120
 - Design and testing of the H-53, 450-gallon auxiliary fuel tank container [AD-A028283] N77-17056
- FUEL-AIR RATIO**
 - Characteristic time correlation of emissions from conventional aircraft type flames [PB-258269/0] N77-17078
 - Summary report on effects at temperature, humidity, and fuel-air ratio on two air-cooled light aircraft engines N77-17086
- FULL SCALE TESTS**
 - Vibration tests on aircraft engines A77-22260

G

GAME THEORY

- Estimation of weapon-radius versus maneuverability trade-off for air-to-air combat [AIAA PAPER 77-35] A77-19787

GAS ANALYSIS

- Evaluation of Halon 1301 system for postcrash aircraft internal cabin fire protection [AD-A032150/5] N77-16003

GAS DYNAMICS

- Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow A77-19732
- Advanced techniques for computation of supersonic flow [AIAA PAPER 77-173] A77-19874
- Applied gasdynamics /4th revised edition/ --- Russian book A77-20123

GAS FLOW

- Applied gasdynamics /4th revised edition/ --- Russian book A77-20123
- Jet engine nozzles A77-22929

GAS JETS

- Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow A77-19732

GAS TURBINE ENGINES

- Combustion modelling within gas turbine engines, some applications and limitations [AIAA PAPER 77-52] A77-19796
- Starting systems for aircraft gas turbine engines --- Russian book A77-20122
- Vortex streets in the wakes of subsonic and transonic turbine cascades A77-20154
- Survey of inlet noise reduction concepts for gas turbine engines A77-20634
- The aero engine and its progress - Fifty years after Griffith --- gas turbine development and technology assessment A77-21594
- Development of materials used in gas turbine engines - R and D guide lines and proposals for a priority scheme A77-22166
- Gas turbine emission control - A systems approach A77-22181

Fatigue of gas-turbine blades made of heat-resistant casting alloys A77-22266

A simplified analysis of propulsion installation losses for computerized aircraft design [NASA-TM-X-73136] N77-16016

Characteristic time correlation of emissions from conventional aircraft type flames [PB-258269/0] N77-17078

GASEOUS DIFFUSION

Variable-area subsonic diffuser study [AD-A029352] N77-16067

GEARS

Helicopter drive system on-condition maintenance capability UH-1/AH-1 [AD-A028032] N77-17048

GENERAL AVIATION AIRCRAFT

Presenting information to the general aviation pilot A77-20608

Measures for enhancing safety in general aviation in the areas of air traffic control, navigation, and meteorology A77-21587

GEOCENTRIC COORDINATES

Application of the Global Positioning System as an attitude reference for near-earth users A77-20675

GEODETTIC SURVEYS

Navigation to surveying accuracy with an inertial system A77-20659

GLASS

An evaluation of window glass for air traffic control tower cabs [AD-A031924/4] N77-16171

GLIDERS

Investigation of the steady-state behavior of two delta-wing hang gliders [NASA-TT-F-17394] N77-17031

GROUND BASED CONTROL

Automatic flight inspection of radio navigation facilities A77-20669

GROUND EFFECT (AERODYNAMICS)

Vertical takeoff lift augmentation - The 'sculptured deck' concept A77-20439

GROUND EFFECT MACHINES

An automatic-control air-jet-propelled ACV A77-20724

GROUP VELOCITY

Three frequency difference OMEGA A77-20673

GUIDANCE SENSORS

The employment of the hybrid flight measurement system for measurements related to the study of a microwave landing system A77-20654

GUST ALLEVIATORS

Maneuver load control and gust load alleviation - Design and application possibilities [DGLR PAPER 76-240] A77-21882

Stabilization, gust alleviation and vibration damping of an elastic aircraft model moving in the wind tunnel [DLR-PB-76-44] N77-17104

GUST LOADS

A rational new approach to the response of an aircraft encountering non-Gaussian atmospheric turbulence [AIAA PAPER 77-115] A77-19837

Application of active controls for the reduction of fatigue loads [NLR-TR-75163-U] N77-16070

GYROSCOPES

Advanced development program for the ring laser gyro navigator --- for strapdown inertial system application A77-20663

H

H-53 HELICOPTER

Design and testing of the H-53, 450-gallon auxiliary fuel tank container [AD-A028283] N77-17056

SUBJECT INDEX

HUMAN PERFORMANCE

- HALF PLANES**
Half-plane scattering applied to ILS grading criteria
A77-21951
- HANDBOOKS**
Inspection of the working order of airplanes and helicopters: Handbook
A77-22541
- HARDWARE**
Interface definition DABS engineering model/ATC (NAPEC) terminal hardware configuration, volume 4 [AD-A025234/6]
N77-16007
- HARMONIC OSCILLATORS**
Unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow
A77-20144
- HEAD-UP DISPLAYS**
Solid state Helmet Mounted Display and Head Position Sensing System
A77-22733
A helmet-mounted light emitting diode /LED/ display applied to the aircraft maneuverability problem
A77-22734
Head-up piloting aids [NASA-TT-P-17389]
N77-17057
Electronic head-up display at pilot's eye level [NASA-TT-P-17390]
N77-17058
- HEAT RESISTANT ALLOYS**
Fatigue of gas-turbine blades made of heat-resistant casting alloys
A77-22266
- HEAVY LIFT HELICOPTERS**
Dynamics of a slung load
A77-20440
Flight test development of a helicopter-towed surface delivery [AD-A028637]
N77-17042
- HELICOPTER CONTROL**
Helicopter motion - Equation linearization
A77-20260
Static aeroelastic twist effects on helicopter rotor-induced velocity
A77-20448
Processor system configuration in the NOE helicopter environment --- Nap-Of-the-Earth
A77-20690
The effect of variations in controls and displays on helicopter instrument approach capability [NASA-TN-D-8385]
N77-17102
- HELICOPTER DESIGN**
The Mini Boat - A life boat for helicopter crewmen [ASME PAPER 76-ENAS-61]
A77-19502
Advanced helicopter designs
A77-20720
Maximum rotor thrust capabilities, articulated and teetering rotors
A77-22668
Advancing blade concept /ABC/ development --- XH-59A flight tests
A77-22669
- HELICOPTER PERFORMANCE**
Inspection of the working order of airplanes and helicopters: Handbook
A77-22541
A prescribed wake lifting surface hover performance analysis
A77-22670
Analysis of phase IIB of FE 43.8 --- Scout helicopter as an observation platform [AD-A028816]
N77-17049
- HELICOPTER TAIL ROTORS**
Elastic pitch beam tail rotor for LOH [AD-A028415]
N77-17055
- HELICOPTERS**
Subjective assessment of simulated helicopter blade-slap noise [NASA-TN-D-8359]
N77-16864
Noise certification considerations for helicopters based on laboratory investigations [AD-A032028/3]
N77-16865
Transonic rotor aerodynamics: Fundamentals of the theory [NASA-TT-P-17395]
N77-16990
Hingeless helicopter rotor with improved stability [NASA-CASE-ARC-10807-1]
N77-17029
- Helicopter drive system on-condition maintenance capability UH-1/AH-1 [AD-A028032]
N77-17048
- HELMETS**
Solid state Helmet Mounted Display and Head Position Sensing System
A77-22733
A helmet-mounted light emitting diode /LED/ display applied to the aircraft maneuverability problem
A77-22734
- HIGH ASPECT RATIO**
Development of a small high-aspect-ratio canard aircraft
A77-22009
- HIGH SPEED**
Single-stage, low-noise, advanced technology fan. Volume 4: Fan aerodynamics. Section 1: Results and analysis [NASA-CR-134892]
N77-17060
Single stage, low noise, advanced technology fan. Volume 4: Fan aerodynamics. Section 2: Overall and blade element performance data tabulations [NASA-CR-134893]
N77-17061
- HIGH VOLTAGES**
High voltage design guide for airborne equipment [AD-A029268]
N77-16272
- HODOGRAPHS**
Review of the application of hodograph theory to transonic aerofoil design and theoretical and experimental analysis of shock-free aerofoils --- noting pressure distributions [NLR-MP-75033-U]
N77-15991
Hodograph theory and shock free airfoils [NLR-MP-76002-U]
N77-15993
- HOMING DEVICES**
A launch transient experiment for imaging seekers [AD-A028625]
N77-16049
- HORIZON SCANNERS**
The Malcolm Horizon --- pilot performance
N77-16054
- HORIZONTAL TAIL SURFACES**
Predicting the loading of tail planes in the preliminary phase of aircraft design
A77-21874
- HOVERING**
Analysis of unsteady airloads of helicopter rotors in hover [AIAA PAPER 77-159]
A77-19865
A prescribed wake lifting surface hover performance analysis
A77-22670
- HUBS**
Composite hubs for low cost gas turbine engines [NASA-TN-X-73578]
N77-17066
- HUMAN FACTORS ENGINEERING**
Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings
A77-20603
Investigation into the optimum use of advanced displays in future transport aircraft
A77-20606
Progress report on the Viggen with emphasis on man-machine design
A77-22018
Cockpit information requirements - Common elements
A77-22729
Integrated color display system --- for aircraft
A77-22737
Visual presentation of cockpit information including special devices used for particular conditions of flying [AGARD-CP-201]
N77-16050
The development of aircraft instruments
N77-16051
Evaluation of cockpit lighting
N77-16052
- HUMAN PERFORMANCE**
A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results [AD-A029051]
N77-16071

HUMAN REACTIONS

SUBJECT INDEX

HUMAN REACTIONS

Subjective assessment of simulated helicopter blade-slap noise
[NASA-TN-D-8359] N77-16864

HUMAN TOLERANCES

A comparison of a laboratory and field study of annoyance and acceptability of aircraft noise exposures --- human reactions and tolerance
[NASA-CR-2772] N77-17608

HUMIDITY MEASUREMENT

Ambient temperature and humidity correction factors for exhaust emissions from two classes of aircraft turbine engines
[AD-A031923/6] N77-16064

HYBRID NAVIGATION SYSTEMS

The employment of the hybrid flight measurement system for measurements related to the study of a microwave landing system
A77-20654

Today's system - Inertial Omega --- hybrid navigation system
A77-21592

HYDROCARBON COMBUSTION

Application of automobile emission control technology to light piston aircraft engines
N77-17083

HYDRODYNAMICS

Applied gasdynamics /4th revised edition/ --- Russian book
A77-20123

HYDROGEN FUELS

Influence of fuel temperature on supersonic mixing and combustion of hydrogen
[AIAA PAPER 77-17] A77-19778

HYPERBOLIC DIFFERENTIAL EQUATIONS

Advanced techniques for computation of supersonic flow
[AIAA PAPER 77-173] A77-19874

HYPERSONIC AIRCRAFT

Scramjet exhaust simulation technique for hypersonic aircraft nozzle design and aerodynamic tests
[AIAA PAPER 77-82] A77-19815

HYPERSONIC FLIGHT

Investigation of the size of the wake of a cone flying at hypersonic speed
A77-19746

HYPERSONIC FLOW

Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow
A77-19732

Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight
[AIAA PAPER 77-5] A77-19766

On Newtonian flow past power-law bodies
A77-20093

Incipient separation of leeward flow past a lifting plate in viscous hypersonic flow
A77-20095

Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113] A77-22228

HYPERSONIC HEAT TRANSFER

Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows
[AIAA PAPER 77-92] A77-19821

HYPERSONIC REENTRY

Hypersonic flow over indented nosetips
[AIAA PAPER 77-91] A77-19820

HYPERSONIC TEST APPARATUS

Investigation of the size of the wake of a cone flying at hypersonic speed
A77-19746

ICE PREVENTION

Winter-related service operations on airports
A77-22117

IDEAL GAS

Investigation of strongly underexpanded submerged jets
A77-19743

IMAGING TECHNIQUES

Airframe noise measurements by acoustic imaging
[AIAA PAPER 77-55] A77-19799
Tactical air applications for advanced multisensor imagery processing and display techniques
A77-22738

IMPELLERS

Evaluation of isothermal forgings for T53 impellers
[AD-A030469] N77-17227

IN-FLIGHT MONITORING

Methods and techniques of vibration testing in flight
[ONERA, TP NO. 1976-120] A77-20868

INCLINATION

Hingeless helicopter rotor with improved stability
[NASA-CASE-ARC-10807-1] N77-17029

INCOMPRESSIBLE FLOW

Nonlinear steady incompressible lifting-surface analysis with wake roll-up
A77-20085

Unsteady aerodynamic forces acting on loaded two-dimensional blades in nonuniform incompressible flows
A77-20137

INERTIAL NAVIGATION

Error model of an inertial navigation system for integrated navigation based on adjustment according to the method of least squares
A77-20652

New frontiers in aerospace navigation; Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976
A77-20655

Improved navigation using adaptive Kalman filtering
A77-20657

Navigation to surveying accuracy with an inertial system
A77-20659

Advanced development program for the ring laser gyro navigator --- for strapdown inertial system application
A77-20663

Automatic flight inspection of radio navigation facilities
A77-20669

Dual INS velocity error reduction through new damping techniques
A77-20678

Today's system - Inertial Omega --- hybrid navigation system
A77-21592

GIANT CHANGE final report, KC-135 dual INS test
[AD-A028788] N77-17027

INFLATABLE STRUCTURES

The Mini Boat - A life boat for helicopter crewmen
[ASME PAPER 76-ENAS-61] A77-19502

INFORMATION MANAGEMENT

Operational requirements for advanced fighter aircrew displays
A77-22728

Evaluated numerical data for the SST and chlorofluorocarbon problems: A case study of how to help the engineer and the modellers
N77-16942

INFORMATION SYSTEMS

The maneuvering flight path display
A77-22730

INFRARED SPECTROSCOPY

Aircraft propulsion lubricating film additives: Boundary lubricant surface films, volume 3
[AD-A029267] N77-16356

INLET FLOW

Flow in turbomachines with nonuniform inlet velocity distribution
A77-19708

Computation of low speed flow about an asymmetric nacelle at incidence
[AIAA PAPER 77-143] A77-19857

Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[AIAA PAPER 77-144] A77-19983

INLET PRESSURE

On the unsteady aerodynamic rotor blade loading in a transonic axial flow compressor with steady-state inlet distortion
A77-20153

SUBJECT INDEX

JET NOZZLES

- Internal flow characteristics of a multistage compressor with inlet pressure distortion --- J85-13 turbojet engine studies [NASA-TM-X-3446] N77-17070
- INSPECTION**
Inspection of the working order of airplanes and helicopters: Handbook A77-22541
- INSTRUMENT APPROACH**
The effect of variations in controls and displays on helicopter instrument approach capability [NASA-TN-D-8385] N77-17102
- INSTRUMENT ERRORS**
Precision DME for future landing systems - One solution A77-21421
- INSTRUMENT LANDING SYSTEMS**
The employment of the hybrid flight measurement system for measurements related to the study of a microwave landing system A77-20654
Half-plane scattering applied to ILS grading criteria A77-21951
- INSTRUMENT ORIENTATION**
On the applicability of integrated circuit technology to general aviation orientation estimation [NASA-CR-151952] N77-17356
- INTAKE SYSTEMS**
On the unsteady aerodynamic rotor blade loading in a transonic axial flow compressor with steady-state inlet distortion A77-20153
- INTEGRAL EQUATIONS**
Derivation of an integral equation for transonic flows A77-22685
Integration of the 3-D harmonic kernel [AD-A029550] N77-17015
- INTEGRATED CIRCUITS**
On the applicability of integrated circuit technology to general aviation orientation estimation [NASA-CR-151952] N77-17356
- INTERFACES**
Interface definition DABS engineering model/ATC (NAFEC) terminal hardware configuration, volume 4 [AD-A025234/6] N77-16007
- INTERFERENCE DRAG**
Jet exhaust and support interference effects on the transonic aerodynamic characteristics of a fighter model with two widely spaced engines [NASA-TM-X-3424] N77-15978
- INTERFERENCE LIFT**
Jet exhaust and support interference effects on the transonic aerodynamic characteristics of a fighter model with two widely spaced engines [NASA-TM-X-3424] N77-15978
- INTERNAL COMPRESSION INLETS**
Internal flow characteristics of a multistage compressor with inlet pressure distortion --- J85-13 turbojet engine studies [NASA-TM-X-3446] N77-17070
- INTERNAL WAVES**
The transmission of acoustic plane-waves at a jet exhaust [AIAA PAPER 77-22] A77-22207
- INVISCID FLOW**
Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows A77-19742
Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight [AIAA PAPER 77-5] A77-19766
Effects of inviscid parallel shear flows on steady and unsteady aerodynamics and flutter [AIAA PAPER 77-158] A77-19864
An inviscid model for submerged transonic wall jets [AIAA PAPER 77-174] A77-19875
Calculation of transonic wing flows by grid embedding [AIAA PAPER 77-207] A77-19899
An approximate calculation of the strong interaction on a transonic airfoil [AIAA PAPER 77-210] A77-19900
- Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings [AIAA PAPER 77-209] A77-22244
Derivation of an integral equation for transonic flows A77-22685
- ISOTHERMAL PROCESSES**
Evaluation of isothermal forgings for T53 impellers [AD-A030469] N77-17227
- J**
- J-85 ENGINE**
Internal flow characteristics of a multistage compressor with inlet pressure distortion --- J85-13 turbojet engine studies [NASA-TM-X-3446] N77-17070
- JET AIRCRAFT**
High angle of attack of stability and control [AD-A027877] N77-17106
- JET AIRCRAFT NOISE**
Structural acoustic considerations for aircraft A77-20633
Jet noise source modification due to forward flight [AIAA PAPER 77-58] A77-22215
The 727/JT8D jet and fan noise flight effects study [AD-A031877/4] N77-16063
- JET ENGINES**
A general theory of turbulent combustion - The Lagrangian aspects [AIAA PAPER 77-141] A77-19855
Jet engine nozzles A77-22929
The 727/JT8D jet and fan noise flight effects study [AD-A031877/4] N77-16063
Compressor critical response time determination study [AD-A028882] N77-17074
- JET EXHAUST**
Scramjet exhaust simulation technique for hypersonic aircraft nozzle design and aerodynamic tests [AIAA PAPER 77-82] A77-19815
An evaluation of jet simulation parameters for nozzle/afterbody testing at transonic Mach numbers [AIAA PAPER 77-106] A77-19830
Vertical takeoff lift augmentation - The 'sculptured deck' concept A77-20439
The transmission of acoustic plane-waves at a jet exhaust [AIAA PAPER 77-22] A77-22207
Jet exhaust and support interference effects on the transonic aerodynamic characteristics of a fighter model with two widely spaced engines [NASA-TM-X-3424] N77-15978
- JET FLAPS**
A nonlinear theory for airfoils with trailing-edge jet flap [NASA-TN-D-8368] N77-15981
- JET FLOW**
Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow A77-19732
Investigation of strongly underexpanded submerged jets A77-19743
Turbulence generated noise on either side of a double layer jet A77-20238
- JET IMPINGEMENT**
Vertical takeoff lift augmentation - The 'sculptured deck' concept A77-20439
- JET LIFT**
Flow effects at cross blown lifting jets of V/STOL aircraft and their reaction on aerodynamic forces and moments of the nacelle [DLR-FB-76-34] N77-17008
- JET MIXING FLOW**
An experimental and numerical study of the 3-D mixing flows of a turbofan engine exhaust system [AIAA PAPER 77-204] A77-19896
- JET NOZZLES**
Jet engine nozzles A77-22929

JET THRUST

JET THRUST

Pollutant formation in fuel lean recirculating flows
 --- in an Opposed Reacting Jet Combustor
 [NASA-CR-2785] N77-17069

K

KALMAN FILTERS

Improved navigation using adaptive Kalman filtering
 A77-20657

KERNEL FUNCTIONS

Integration of the 3-D harmonic kernel
 [AD-A029550] N77-17015

KINETIC ENERGY

Vortex interactions and decay in aircraft wakes
 A77-22678

L

LAMINAR BOUNDARY LAYER

Experimental investigation of the characteristics
 of small-dimensioned nozzles
 A77-19739

Prediction of laminar and turbulent boundary layer
 flow separation in V/STOL engine inlets
 [AIAA PAPER 77-144] A77-19983

A general method for calculating three-dimensional
 compressible laminar and turbulent boundary
 layers on arbitrary wings
 [NASA-CR-2777] N77-16994

Development of technology for the fabrication of
 reliable laminar flow control panels on subsonic
 transports
 [NASA-CR-145125] N77-17038

Prediction of laminar and turbulent boundary layer
 flow separation in V/STOL engine inlets
 [NASA-TN-X-73575] N77-17063

LAMINAR FLOW

Calculation of supersonic laminar flow about a
 blunt body and the flow in the wake
 A77-22934

Laminar separation near the trailing edge of a
 thin profile
 [ESA-TT-343] N77-15996

Laminar separation near the trailing edge of a
 thin profile
 [ONERA-NT-1976-3] N77-16297

LAMINAR WAKES

A theoretical investigation of laminar wakes
 behind airfoils and the resulting noise pattern
 A77-22045

LANDING AIDS

VTOL landing aid using low-frequency near-field
 techniques
 A77-20672

Precision DME for future landing systems - One
 solution
 A77-21421

TRACALS evaluation report. Communications station
 evaluation report, Kadana AB, Japan, 4 March -
 16 March 1976
 [AD-A029713] N77-17028

LANDING GEAR

An experimental investigation of airframe
 component interference noise
 [AIAA PAPER 77-56] A77-19800

LATERAL STABILITY

Lateral equilibrium of asymmetrical swept wings -
 Aileron control vs geometric twist
 A77-20441

LAUNCH VEHICLES

Mark 2 nose-gear-launch system hardware evaluation
 report
 [AD-A029020] N77-17041

LEADING EDGE SLATS

Effect of drooped-nose flaps on the experimental
 force and moment characteristics of an oblique
 wing
 [NASA-TN-X-3398] N77-16068

LEADING EDGE SWEEP

Effects of wing leading-edge radius and Reynolds
 number on longitudinal aerodynamic
 characteristics of highly swept wing-body
 configurations at subsonic speeds
 [NASA-TN-D-8361] N77-15980

LEADING EDGES

Flow measurements in leading edge vortices
 [AIAA PAPER 77-11] A77-19772

SUBJECT INDEX

Nonlinear, unsteady aerodynamic loads on
 rectangular and delta wings

[AIAA PAPER 77-156] A77-22238

LEAST SQUARES METHOD

Error model of an inertial navigation system for
 integrated navigation based on adjustment
 according to the method of least squares
 A77-20652

System identification for nonlinear aerodynamic
 flight regimes
 A77-22708

LIPT

A numerical method for the exact calculation of
 airloads associated with impulsively started wings
 [AIAA PAPER 77-2] A77-19764

An investigation of separation models for the
 prediction of maximum lift
 [AD-A027359] N77-15994

LIPT AUGMENTATION

Vertical takeoff lift augmentation - The
 'sculptured deck' concept
 A77-20439

LIPT DEVICES

Lifting surface theory for wings of arbitrary
 planform
 [AD-A028449] N77-16000

LIPT FANS

Lift/cruise fan V/STOL technology aircraft design
 definition study. Volume 1: Technology flight
 vehicle definition
 [NASA-CR-151931] N77-16013

Lift/cruise fan V/STOL technology aircraft design
 definition study. Volume 2: Propulsion
 transmission system design
 [NASA-CR-151932] N77-16014

Lift/cruise fan V/STOL technology aircraft design
 definition study. Volume 3: Development
 program and budgetary estimates
 [NASA-CR-151933] N77-16015

Follow-on studies for design definition of a
 lift/cruise fan technology V/STOL airplane,
 volume 1
 [NASA-CR-137976] N77-17035

Wind tunnel and ground static tests of a .094
 scale powered model of a modified T-39
 lift/cruise fan V/STOL research airplane
 [NASA-CR-151923] N77-17036

LIFTING BODIES

Analysis of unsteady airloads of helicopter rotors
 in hover
 [AIAA PAPER 77-159] A77-19865

Nonlinear steady incompressible lifting-surface
 analysis with wake roll-up
 A77-20085

Incipient separation of leeward flow past a
 lifting plate in viscous hypersonic flow
 A77-20095

LIFTING ROTORS

A prescribed wake lifting surface hover
 performance analysis
 A77-22670

LIGHT AIRCRAFT

Presenting information to the general aviation pilot
 A77-20608

Convertible aircraft --- for manned and/or RPV
 flight
 A77-20623

Development of a small high-aspect-ratio canard
 aircraft
 A77-22099

Practical aerodynamics of the Yak-18T airplane ---
 Russian book
 A77-22450

Application of automobile emission control
 technology to light piston aircraft engines
 N77-17083

Summary report on effects at temperature,
 humidity, and fuel-air ratio on two air-cooled
 light aircraft engines
 N77-17086

LIGHT EMITTING DIODES

Solid state Helmet Mounted Display and Head
 Position Sensing System
 A77-22733

A helmet-mounted light emitting diode /LED/
 display applied to the aircraft maneuverability
 problem
 A77-22734

SUBJECT INDEX

MILITARY AIRCRAFT

LIGHTING EQUIPMENT

Evaluation of cockpit lighting
N77-16052

An investigation of cockpit lighting for compatibility with use of night-vision goggles, AN/PVS-5
[AD-A029212] N77-17046

LINEARIZATION

Helicopter motion - Equation linearization
A77-20260

LIQUID FLOW

Penetration and break-up of liquid fuel jets in high subsonic speed airstreams
[AIAA PAPER 77-201] A77-19893

LOAD DISTRIBUTION (FORCES)

Predicting the loading of tail planes in the preliminary phase of aircraft design
A77-21874

LONGITUDINAL CONTROL

Flight characteristics studies related to the employment of direct power steering in longitudinal motion
[DGLR PAPER 76-238] A77-21881

LOOP ANTENNAS

VTOL landing aid using low-frequency near-field techniques
A77-20672

LOW ASPECT RATIO WINGS

Effect of drooped-nose flaps on the experimental force and moment characteristics of an oblique wing
[NASA-TM-X-3398] N77-16068
Flight measurements of lifting pressures for a thin low-aspect-ratio wing at subsonic, transonic, and low supersonic speeds
[NASA-TM-X-3405] N77-16996

LOW COST

Simulation analysis of a microcomputer-based, low-cost omega navigation system
A77-20674
A navigation algorithm for the low-cost GPS receiver --- Global Positioning System
A77-20676

LOW NOISE

Single-stage, low-noise, advanced technology fan. Volume 4: Fan aerodynamics. Section 1: Results and analysis
[NASA-CR-134892] N77-17060
Single stage, low noise, advanced technology fan. Volume 4: Fan aerodynamics. Section 2: Overall and blade element performance data tabulations
[NASA-CR-134893] N77-17061

LOW SPEED WIND TUNNELS

Low speed wind tunnel investigation of flight spoilers as trailing-vortex-alleviation devices on an extended-range wide body tri-jet airplane model
[NASA-TN-D-8373] N77-15982

LUBRICATING OILS

Aircraft propulsion lubricating film additives: Boundary lubricant surface films, volume 3
[AD-A029267] N77-16356

M

MACH NUMBER

Flight measurements of lifting pressures for a thin low-aspect-ratio wing at subsonic, transonic, and low supersonic speeds
[NASA-TM-X-3405] N77-16996

MAGNETIC SUSPENSION

Stability derivative measurements with magnetically suspended cone-cylinder models
[AIAA PAPER 77-79] A77-19813

MANAGEMENT

An analysis of an application of aerospace systems engineering process as it affects design
N77-16012

MANEUVERABILITY

A helmet-mounted light emitting diode /LED/ display applied to the aircraft maneuverability problem
A77-22734

MANUFACTURING

Summary of the general aviation manufacturers' position on aircraft piston engine emissions
N77-17098

MARINE ENVIRONMENTS

R.P.Vs in the maritime environment
A77-20620

MARINE PROPULSION

An automatic-control air-jet-propelled ACV
A77-20724

MARINE TECHNOLOGY

Navigation for sea based RPVs
A77-20662

MARK 2 REENTRY BODY

Mark 2 nose-gear-launch system hardware evaluation report
[AD-A029020] N77-17041

MATERIALS TESTS

Development of materials used in gas turbine engines - R and D guide lines and proposals for a priority scheme
A77-22166

MATHEMATICAL MODELS

Combustion modelling within gas turbine engines, some applications and limitations
[AIAA PAPER 77-52] A77-19796

MATRICES (MATHEMATICS)

State-space formulations for flutter analysis
[AIAA PAPER 77-117] A77-22230

MAXIMUM LIKELIHOOD ESTIMATES

System identification for nonlinear aerodynamic flight regimes
A77-22708

MECHANICAL DRIVES

Preproduction test program, Kaflex drive shaft coupling for UH-1 helicopter, phases 8, 9 and 10
[AD-A028202] N77-17044
Helicopter drive system on-condition maintenance capability UH-1/AH-1
[AD-A028032] N77-17048

METAL FATIGUE

Fatigue of gas-turbine blades made of heat-resistant casting alloys
A77-22266

MICROPROCESSORS

Simulation analysis of a microcomputer-based, low-cost omega navigation system
A77-20674
Processor system configuration in the NOE helicopter environment --- Nap-Of-the-Earth
A77-20690

Study and design of flight data recording systems for military aircraft --- Microprocessing flight data for solid state memory storage
[AD-A028862] N77-17446

MICROWAVE LANDING SYSTEMS

The employment of the hybrid flight measurement system for measurements related to the study of a microwave landing system
A77-20654
Report concerning the status of the selection procedure for a new approach and landing system /MLS/
A77-21586

MIDAIR COLLISIONS

General aviation accidents involving aerobatics, 1972 - 1974
[PB-257747/6] N77-17020

MILITARY AIRCRAFT

Remotely piloted vehicles - An Air Force view
A77-20619
Convertible aircraft --- for manned and/or RPV flight
A77-20623

The Aerodyne - An R.P.V. with multiple capability
A77-20626

CCVs - Active control technology creating new military aircraft design potential
A77-21755

On aerodynamic coupling between lateral and longitudinal degrees of freedom --- for military flight conditions
[AIAA PAPER 77-4] A77-22236

Design of military aircraft for minimum cost of ownership
A77-22756

Design and analysis of winglets for military aircraft
[AD-A029345] N77-17040

Study and design of flight data recording systems for military aircraft --- Microprocessing flight data for solid state memory storage
[AD-A028862] N77-17446

MILITARY AVIATION

SUBJECT INDEX

MILITARY AVIATION
The R.P.V. in perspective
A77-20621

MILITARY HELICOPTERS
Processor system configuration in the NOE
helicopter environment --- Nap-Of-the-Earth
A77-20690

MILITARY OPERATIONS
Navigation for sea based RPVs
A77-20662

MISSILE TRAJECTORIES
Viscous perturbation effects on hypersonic
unsteady aerodynamics --- tactical missile flight
[AIAA PAPER 77-5]
A77-19766

MISSION PLANNING
GIANT CHANGE final report, KC-135 dual INS test
[AD-A028788]
N77-17027

MOVING TARGET INDICATORS
Radiocommunication in air navigation
A77-21869

N

NACELLES
Computation of low speed flow about an asymmetric
nacelle at incidence
[AIAA PAPER 77-143]
A77-19857

Nacelle installation analysis for subsonic
transport aircraft
[AIAA PAPER 77-102]
A77-22227

Flow effects at cross blown lifting jets of V/STOL
aircraft and their reaction on aerodynamic
forces and moments of the nacelle
[DLR-FB-76-34]
N77-17008

NASA PROGRAMS
Introduction to NASA contracts --- on engine
modifications to reduce exhaust emissions
N77-17091

NASTRAN
Composite hubs for low cost gas turbine engines
[NASA-TM-X-73578]
N77-17066

NAVIER-STOKES EQUATION
Numerical solution of axisymmetric boattail flow
fields with plume simulators
[AIAA PAPER 77-224]
A77-19909

Numerical solutions of Navier-Stokes equations for
the structure of a trailing vortex
[NASA-TM-X-73361]
N77-16993

NAVIGATION AIDS
A proposition for an advanced aircraft navigation
system for civil air transport
A77-20667

Report concerning the status of the selection
procedure for a new approach and landing system
/HLS/
A77-21586

Experience with the VOR navigation system in the
German Democratic Republic. II
A77-22118

Evaluating the characteristics of luminous colored
cockpit displays
A77-22736

Head-up piloting aids
[NASA-TT-P-17389]
N77-17057

NAVIGATION INSTRUMENTS
Evaluation of the accuracy of community relative
navigation organization concepts
A77-20656

Improved navigation using adaptive Kalman filtering
A77-20657

Navigation to surveying accuracy with an inertial
system
A77-20659

Navigation for sea based RPVs
A77-20662

A modular fail op fail safe strapped-down navigator
A77-20665

Correlation velocity sensor --- aircraft
navigation instrument
A77-20670

Measures for enhancing safety in general aviation
in the areas of air traffic control, navigation,
and meteorology
A77-21587

Visual presentation of cockpit information
including special devices used for particular
conditions of flying
[AGARD-CP-201]
N77-16050

The Malcolm Horizon --- pilot performance
N77-16054

NAVIGATION SATELLITES
Application of the Global Positioning System as an
attitude reference for near-earth users
A77-20675

A navigation algorithm for the low-cost GPS receiver
--- Global Positioning System
A77-20676

NEAR FIELDS
On the not-so-slender wing theory
A77-22679

NEWTONIAN FLUIDS
On Newtonian flow past power-law bodies
A77-20093

NIGHT VISION
Processor system configuration in the NOE
helicopter environment --- Nap-Of-the-Earth
A77-20690

An investigation of cockpit lighting for
compatibility with use of night-vision goggles,
AN/PVS-5
[AD-A029212]
N77-17046

NOISE GENERATORS
A theoretical investigation of laminar wakes
behind airfoils and the resulting noise pattern
A77-22045

NOISE MEASUREMENT
Airframe noise measurements by acoustic imaging
[AIAA PAPER 77-55]
A77-19799

Core noise measurements on a YF-102 turbofan engine
[AIAA PAPER 77-21]
A77-19981

Testing equipment available in France for studying
aircraft and engine noise
A77-21887

Techniques employed in analyzing turbojet noise
A77-21893

The transmission of acoustic plane-waves at a jet
exhaust
[AIAA PAPER 77-22]
A77-22207

NOISE POLLUTION
Inter-noise 76; Proceedings of the International
Conference on Noise Control Engineering,
Washington, D.C., April 5-7, 1976
A77-20629

Data base for predicting noise from civil
aircraft: Flight profile prediction
[PB-257638/7]
N77-16867

NOISE REDUCTION
Flap noise and aerodynamic results for model QCSEE
over-the-wing configurations --- Quiet Clean
Short-haul Experimental Engine program
[AIAA PAPER 77-23]
A77-19982

Inter-noise 76; Proceedings of the International
Conference on Noise Control Engineering,
Washington, D.C., April 5-7, 1976
A77-20629

Survey of inlet noise reduction concepts for gas
turbine engines
A77-20634

Techniques employed in analyzing turbojet noise
A77-21893

Jet noise source modification due to forward flight
[AIAA PAPER 77-58]
A77-22215

The 727/JT8D jet and fan noise flight effects study
[AD-A031877/4]
N77-16063

The effect of forward speed on J85 engine noise
from suppressor nozzles as measured in the
NASA-Ames 40- by 80-foot wind tunnel
[NASA-TN-D-8426]
N77-17068

Theoretical and experimental investigation of
noise shielding for jet engines --- acoustic and
aerodynamic interference measurements
[BNPT-PB-W-76-09]
N77-17072

NOISE SPECTRA
Flap noise and aerodynamic results for model QCSEE
over-the-wing configurations --- Quiet Clean
Short-haul Experimental Engine program
[AIAA PAPER 77-23]
A77-19982

NOISE TOLERANCE
Subjective assessment of simulated helicopter
blade-slap noise
[NASA-TN-D-8359]
N77-16964

Noise certification considerations for helicopters
based on laboratory investigations
[AD-A032028/3]
N77-16865

SUBJECT INDEX

PATTERN RECOGNITION

A comparison of a laboratory and field study of annoyance and acceptability of aircraft noise exposures --- human reactions and tolerance
[NASA-CR-2772] N77-17608

NONLINEAR EQUATIONS
A nonlinear theory for airfoils with trailing-edge jet flap
[NASA-TN-D-8368] N77-15981

Nonlinear curvature expressions for combined flapwise bending, chordwise bending, torsion and extension of twisted rotor blades
[NASA-TM-X-73997] N77-16376

NONLINEAR SYSTEMS
System identification for nonlinear aerodynamic flight regimes
A77-22708

NONUNIFORM FLOW
Unsteady aerodynamic forces acting on loaded two-dimensional blades in nonuniform incompressible flows
A77-20137

Propelled time-dependent forces due to nonuniform inflow
N77-16060

NOSE CONES
Investigation of the size of the wake of a cone flying at hypersonic speed
A77-19746

Stability derivative measurements with magnetically suspended cone-cylinder models
[AIAA PAPER 77-79] A77-19813

NOSES (FOREBODIES)
Hypersonic flow over indented nosetips
[AIAA PAPER 77-91] A77-19820

NOZZLE DESIGN
Scramjet exhaust simulation technique for hypersonic aircraft nozzle design and aerodynamic tests
[AIAA PAPER 77-82] A77-19815

NOZZLE FLOW
Experimental investigation of the characteristics of small-dimensioned nozzles
A77-19739

Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows
A77-19742

Investigation of strongly underexpanded submerged jets
A77-19743

Calculation of base pressure in ejector nozzles of different length for the case of a zero ejection coefficient
A77-19747

Jet engine nozzles
A77-22929

NOZZLE GEOMETRY
Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows
A77-19742

Reynolds number and nozzle afterbody configuration effects on model forebody and afterbody drag
[AIAA PAPER 77-103] A77-19827

Analytical study of viscous effects on transonic flow over boattail nozzles
[AIAA PAPER 77-223] A77-19908

NUCLEAR EXPLOSION EFFECT
Aeromechanics of mission completion for structurally damaged aircraft
[AIAA PAPER 77-112] A77-19836

NUCLEATION
Gas turbine emission control - A systems approach
A77-22181

NUMERICAL ANALYSIS
Prediction of pressure distributions on axisymmetric bodies in transonic flow
[AIAA PAPER 77-226] A77-22248

O

OBLIQUE WINGS
Effect of drooped-nose flaps on the experimental force and moment characteristics of an oblique wing
[NASA-TM-X-3398] N77-16068

Oblique wing transonic transport configuration development
[NASA-CR-151928] N77-17037

OBSERVATION AIRCRAFT
An avionics design philosophy for a Canadian coastal patrol aircraft
A77-19650

OH-6 HELICOPTER
Elastic pitch beam tail rotor for LOH
[AD-A028415] N77-17055

OH-58 HELICOPTER
Elastic pitch beam tail rotor for LOH
[AD-A028415] N77-17055

OMEGA NAVIGATION SYSTEM
Three frequency difference OMEGA
A77-20673

Simulation analysis of a microcomputer-based, low-cost omega navigation system
A77-20674

Today's system - Inertial Omega --- hybrid navigation system
A77-21592

OPERATIONAL PROBLEMS
Operational problems of supersonic aircraft
A77-22116

OPERATIONS RESEARCH
Operational requirements for flight control and navigation systems for short haul transport aircraft
[NASA-CR-137975] N77-17034

OPTICAL DATA PROCESSING
Tactical air applications for advanced multisensor imagery processing and display techniques
A77-22738

OPTICAL MEASURING INSTRUMENTS
Solid state Helmet Mounted Display and Head Position Sensing System
A77-22733

OPTIMAL CONTROL
Optimal control of thrust and angle of attack of an aircraft performing a climb-acceleration maneuver
A77-19329

OPTIMIZATION
Airfoil design by optimization
A77-20449

OSCILLATING FLOW
The development of flow boundary layers in turbomachines
A77-20086

OSCILLATIONS
Analysis of the development of dynamic stall based on oscillating airfoil experiments
[NASA-TN-D-8382] N77-16999

P

P-531 HELICOPTER
Analysis of phase IIB of PE 43.8 --- Scout helicopter as an observation platform
[AD-A028816] N77-17049

PANEL FLUTTER
Effects of inviscid parallel shear flows on steady and unsteady aerodynamics and flutter
[AIAA PAPER 77-158] A77-19864

PANELS
Development of technology for the fabrication of reliable laminar flow control panels on subsonic transports
[NASA-CR-145125] N77-17038

PARACHUTES
Transonic wind-tunnel tests of a lifting parachute model
[NASA-TM-X-73982] N77-15987

PARALLEL FLOW
Effects of inviscid parallel shear flows on steady and unsteady aerodynamics and flutter
[AIAA PAPER 77-158] A77-19864

Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer
[AIAA PAPER 77-157] A77-22239

PASSENGER AIRCRAFT
Energy considerations in aeronautical transportation /The W. Rupert Turnbull Lecture/
A77-19649

The technical concept of the IL-62M. II - Fuel system
A77-22120

PATTERN RECOGNITION
Aircraft identification by moment invariants
A77-21683

PERFORMANCE PREDICTION

SUBJECT INDEX

PERFORMANCE PREDICTION

A prescribed wake lifting surface hover performance analysis

A77-22670

PERFORMANCE TESTS

Shaping the flight behavior of the 747SP

A77-21320

PERTURBATION THEORY

Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight [AIAA PAPER 77-5] A77-19766

Remarks on the suitability of various transonic small perturbation equations to describe three-dimensional transonic flow; examples of computations using a fully-conservative rotated difference scheme --- three typical shock interactions [NLR-MP-75039-U] N77-15992

PHASE DEVIATION

Three frequency difference OMEGA

A77-20673

PILOT PERFORMANCE

Handling quality criterion for heading control --- aileron-rudder sequencing for coordinated turns

A77-20443

Symposium on the Presentation of Information to Pilots, London, England, March 18, 1976, Proceedings

A77-20603

Flight information for airline pilots - The certification angle

A77-20605

Presenting information to the general aviation pilot

A77-20608

The Malcolm Horizon --- pilot performance

N77-16054

Terrain following using stereo television

N77-16056

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-27A variable stability aircraft. Volume 2: Background information and supporting data [AD-A028874] N77-16072

PILOT TRAINING

Design of military aircraft for minimum cost of ownership

A77-22756

PILOTS (PERSONNEL)

Electronic head-up display at pilot's eye level [NASA-TT-F-17390] N77-17058

PISTON ENGINES

Aircraft Piston Engine Exhaust Emission Symposium [NASA-CP-2005] N77-17081

Development of EPA aircraft piston engine emission standards --- for air quality

N77-17082

Application of automobile emission control technology to light piston aircraft engines

N77-17083

Emissions data by category of engines

N77-17087

Avco Lycoming emission and flight test results

N77-17088

TCM aircraft piston engine emission reduction program

N77-17092

Summary of the general aviation manufacturers' position on aircraft piston engine emissions

N77-17098

Review of measurement and testing problems

N77-17100

PITCH (INCLINATION)

On aerodynamic coupling between lateral and longitudinal degrees of freedom --- for military flight conditions

A77-22206

Wind tunnel test and calibration techniques for the measurement of damping and dynamic cross derivatives due to pitching and yawing

A77-22221

Reverse pitch fan with divided splitter [NASA-CASE-LEW-12760-1] N77-17059

PITCHING MOMENTS

Jet exhaust and support interference effects on the transonic aerodynamic characteristics of a fighter model with two widely spaced engines [NASA-TN-X-3424] N77-15978

Elastic pitch beam tail rotor for LOH [AD-A028415] N77-17055

PLANE WAVES

The transmission of acoustic plane-waves at a jet exhaust

A77-22207

POINTING CONTROL SYSTEMS

Evaluation of the accuracy of community relative navigation organization concepts

A77-20656

POLLUTION CONTROL

Gas turbine emission control - A systems approach

A77-22191

POSITION (LOCATION)

Application of the Global Positioning System as an attitude reference for near-earth users

A77-20675

POSITION ERRORS

Navigation to surveying accuracy with an inertial system

A77-20659

POSITION INDICATORS

Solid state Helmet Mounted Display and Head Position Sensing System

A77-22733

POTENTIAL FLOW

A numerical method for the exact calculation of airloads associated with impulsively started wings [AIAA PAPER 77-2] A77-19764

Nonlinear steady incompressible lifting-surface analysis with wake roll-up

A77-20085

Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer [AIAA PAPER 77-157] A77-22239

On the not-so-slender wing theory

A77-22679

PREDICTION ANALYSIS TECHNIQUES

The scatter factor in the reliability assessment of aircraft structures

A77-20445

Application of dimensional analysis to predict airplane stopping distance

A77-20446

Prediction of pressure distributions on axisymmetric bodies in transonic flow [AIAA PAPER 77-226] A77-22248

Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets [NASA-TN-X-73575] N77-17063

PREMIXED FLAMES

A general theory of turbulent combustion - The Lagrangian aspects [AIAA PAPER 77-141] A77-19855

PRESSURE DISTRIBUTION

An approximate calculation of the strong interaction on a transonic airfoil

A77-19900

Unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow

A77-20144

Airfoil design by optimization

A77-20449

Pressures over a sharp-edged air intake functioning in subsonic flow at reduced flowrate [ONERA, TP NO. 1976-127] A77-20870

A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations

A77-22205

Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer [AIAA PAPER 77-157] A77-22239

Prediction of pressure distributions on axisymmetric bodies in transonic flow [AIAA PAPER 77-226] A77-22248

Pressure distribution on a 1- by 3-meter semispan wing at sweep angles from 0 deg to 40 deg in subsonic flow [NASA-TN-D-8307] N77-15979

Flight measurements of lifting pressures for a thin low-aspect-ratio wing at subsonic, transonic, and low supersonic speeds [NASA-TN-X-3405] N77-16996

Supersonic pressure measurements and comparison of theory to experiment for an arrow-wing configuration [NASA-CR-145046] N77-17000

SUBJECT INDEX

REMOTELY PILOTED VEHICLES

PRESSURE OSCILLATIONS
 Fluctuating pressure environment of a drag reduction spike
 [AIAA PAPER 77-90] A77-19819

PROBABILITY DENSITY FUNCTIONS
 A rational new approach to the response of an aircraft encountering non-Gaussian atmospheric turbulence
 [AIAA PAPER 77-115] A77-19837

PRODUCT DEVELOPMENT
 Development of materials used in gas turbine engines - B and D guide lines and proposals for a priority scheme
 A77-22166

PRODUCTION ENGINEERING
 Advanced composites manufacturing as influenced by design --- for A-7D aircraft outer wing panel
 A77-22145

PROPELLER BLADES
 The propulsion system of the aircraft Z-37. I
 A77-22121

PROPELLER DRIVE
 The turbulent wake behind slender propeller-driven bodies at angle of attack
 [AIAA PAPER 77-133] A77-22234

PROPELLER EFFICIENCY
 Propelled time-dependent forces due to nonuniform inflow
 N77-16060

PROPULSION SYSTEM CONFIGURATIONS
 An automatic-control air-jet-propelled ACV
 A77-20724
 The propulsion system of the aircraft Z-37. I
 A77-22121
 Lift/cruise fan V/STOL technology aircraft design definition study. Volume 2: Propulsion transmission system design
 [NASA-CR-151932] N77-16014

PROPULSION SYSTEM PERFORMANCE
 A simplified analysis of propulsion installation losses for computerized aircraft design
 [NASA-TM-X-73136] N77-16016

PROPULSIVE EFFICIENCY
 Alternative general-aircraft engines
 N77-17097

PSYCHOACOUSTICS
 Noise certification considerations for helicopters based on laboratory investigations
 [AD-A032028/3] N77-16865
 A comparison of a laboratory and field study of annoyance and acceptability of aircraft noise exposures --- human reactions and tolerance
 [NASA-CR-2772] N77-17608

Q

QUIET ENGINE PROGRAM
 Flap noise and aerodynamic results for model QCSEE over-the-wing configurations --- Quiet Clean Short-haul Experimental Engine program
 [AIAA PAPER 77-23] A77-19982
 Flap noise and aerodynamic results for model QCSEE over-the-wing configurations
 [NASA-TM-X-73588] N77-17065

R

RADAR NAVIGATION
 New frontiers in aerospace navigation; Proceedings of the Bicentennial National Aerospace Symposium, Warminster, Pa., April 27, 28, 1976
 A77-20655

RADIATION DETECTORS
 Attitude control of a pilotless aircraft by radioactive probes
 [ONERA, TP NO. 1976-112] A77-20867

RADIO COMMUNICATION
 Radiocommunication in air navigation
 A77-21869

RADIO NAVIGATION
 Automatic flight inspection of radio navigation facilities
 A77-20669
 Radiocommunication in air navigation
 A77-21869

RADIO SCATTERING
 Half-plane scattering applied to ILS grading criteria
 A77-21951

RADIOACTIVE MATERIALS
 Attitude control of a pilotless aircraft by radioactive probes
 [ONERA, TP NO. 1976-112] A77-20867

RANDOM PROCESSES
 A rational new approach to the response of an aircraft encountering non-Gaussian atmospheric turbulence
 [AIAA PAPER 77-115] A77-19837

RANGE FINDERS
 An Extended range Sensor Package (ESP)
 [AD-A027850] N77-17025

RANGEFINDING
 Evaluation of the accuracy of community relative navigation organization concepts
 A77-20656

REAL TIME OPERATION
 RECON 6: A real-time, wide-angle, solid-state reconnaissance camera system for high-speed, low-altitude aircraft
 N77-17281

RECIRCULATIVE FLUID FLOW
 Pollutant formation in fuel lean recirculating flows --- in an Opposed Reacting Jet Combustor
 [NASA-CR-2785] N77-17069

RECONNAISSANCE AIRCRAFT
 An avionics design philosophy for a Canadian coastal patrol aircraft
 A77-19650
 Analysis of phase IIB of PE 43.8 --- Scout helicopter as an observation platform
 [AD-A028816] N77-17049

RECTANGULAR WINGS
 Flow survey behind wings
 [AIAA PAPER 77-175] A77-19876

REENTRY VEHICLES
 Hypersonic flow over indented nosetips
 [AIAA PAPER 77-91] A77-19820
 Boundary layer transition flight test observations --- for reentry vehicles
 [AIAA PAPER 77-125] A77-22231

REINFORCING FIBERS
 Teflon airframe bearings - Their advantages and limitations
 A77-22146
 A technology plan for electromagnetic characteristics of advanced composites
 [AD-A030507] N77-17175

RELAXATION METHOD (MATHEMATICS)
 An inviscid model for submerged transonic wall jets
 [AIAA PAPER 77-174] A77-19875
 Calculation of transonic wing flows by grid embedding
 [AIAA PAPER 77-207] A77-19899

RELIABILITY ANALYSIS
 Cooling methods for aircraft electronics equipment
 [ASME PAPER 76-ENAS-51] A77-19492
 The scatter factor in the reliability assessment of aircraft structures
 A77-20445

RELIABILITY ENGINEERING
 Inspection of the working order of airplanes and helicopters: Handbook
 A77-22541

REMOTELY PILOTED VEHICLES
 Remotely piloted vehicles - An Air Force view
 A77-20619
 R.P.Vs in the maritime environment
 A77-20620
 The R.P.V. in perspective
 A77-20621
 Remotely piloted vehicles - The influence of system thinking on applied technology
 A77-20622
 Convertible aircraft --- for manned and/or RPV flight
 A77-20623
 The Aerodyne - An R.P.V. with multiple capability
 A77-20626
 Skyspy - A ducted RPV fan
 A77-20627
 B.A.C. experience with small fixed wing and rotary wing R.P.Vs
 A77-20528
 Navigation for sea based RPVs
 A77-20662
 Attitude control of a pilotless aircraft by radioactive probes
 [ONERA, TP NO. 1976-112] A77-20867

RESEARCH AIRCRAFT

SUBJECT INDEX

Compass cope flight control system redundancy study
[AD-A029021] N77-17105

RESEARCH AIRCRAFT

A forebody design technique for highly integrated
bottom-mounted scramjets with application to a
hypersonic research airplane
[NASA-TN-D-8369] N77-16019

RESEARCH AND DEVELOPMENT

B.A.C. experience with small fixed wing and rotary
wing R.P.Vs
A77-20628

Transport airplane flight deck development survey
and analysis: Report and recommendations
[NASA-CR-145121] N77-17030

RESEARCH VEHICLES

A subsonic flow investigation on a research body
at high angles of attack
[AIAA PAPER 77-180] A77-22240

RESPONSE BIAS

Compressor critical response time determination
study
[AD-A028882] N77-17074

REVERSED FLOW

Reverse pitch fan with divided splitter
[NASA-CASE-LEW-12760-1] N77-17059

REYNOLDS NUMBER

Experimental investigation of the characteristics
of small-dimensioned nozzles
A77-19739

Reynolds number and nozzle afterbody configuration
effects on model forebody and afterbody drag
[AIAA PAPER 77-103] A77-19827

Effects of wing leading-edge radius and Reynolds
number on longitudinal aerodynamic
characteristics of highly swept wing-body
configurations at subsonic speeds
[NASA-TN-D-8361] N77-15980

RIDING QUALITY

An analytical method for ride quality of flexible
airplanes
A77-20080

RIGID ROTORS

Hingeless helicopter rotor with improved stability
[NASA-CASE-ARC-10807-1] N77-17029

RING LASERS

Advanced development program for the ring laser
gyro navigator --- for strapdown inertial system
application
A77-20663

A modular fail op fail safe strapped-down navigator
A77-20665

ROTARY WING AIRCRAFT

Fifty years later - The new Helicostat --- rotary
wing propelled airships
A77-20025

B.A.C. experience with small fixed wing and rotary
wing R.P.Vs
A77-20628

REXOR rotorcraft simulation. Volume 3: User's
manual
[AD-A028417] N77-17054

ROTARY WINGS

Analysis of unsteady airloads of helicopter rotors
in hover
[AIAA PAPER 77-159] A77-19865

Static aeroelastic twist effects on helicopter
rotor-induced velocity
A77-20448

Advanced helicopter designs
A77-20720

Maximum rotor thrust capabilities, articulated and
teetering rotors
A77-22668

Advancing blade concept /ABC/ development ---
XH-59A flight tests
A77-22669

Transonic rotor aerodynamics: Fundamentals of the
theory
[NASA-TT-P-17395] N77-16990

Hingeless helicopter rotor with improved stability
[NASA-CASE-ARC-10807-1] N77-17029

ROTATING BODIES

A subsonic flow investigation on a research body
at high angles of attack
[AIAA PAPER 77-180] A77-22240

ROTOR AERODYNAMICS

Detailed measurements of the periodically unsteady
flow produced by rotor and stator wake
interaction in a multistage turbomachine
[AIAA PAPER 77-202] A77-19894

Transonic rotor aerodynamics: Fundamentals of the
theory
[NASA-TT-P-17395] N77-16990

ROTOR BLADES (TURBOMACHINERY)

Experimental and theoretical investigations of the
aerodynamic damping of turbojet rotor blade
vibrations
A77-20141

On the unsteady aerodynamic rotor blade loading in
a transonic axial flow compressor with
steady-state inlet distortion
A77-20153

Nonlinear curvature expressions for combined
flapwise bending, chordwise bending, torsion and
extension of twisted rotor blades
[NASA-TN-X-73997] N77-16376

Single-stage, low-noise, advanced technology fan.
Volume 4: Fan aerodynamics. Section 1:
Results and analysis
[NASA-CR-134892] N77-17060

Single stage, low noise, advanced technology fan.
Volume 4: Fan aerodynamics. Section 2:
Overall and blade element performance data
tabulations
[NASA-CR-134893] N77-17061

ROTOR SPEED

Maximum rotor thrust capabilities, articulated and
teetering rotors
A77-22668

ROTORS

Vibration measurements on the rotor shaft of the
UH-1 helicopter
[AD-A028924] N77-17047

RUDDERS

Handling quality criterion for heading control ---
aileron-rudder sequencing for coordinated turns
A77-20443

RUNWAY CONDITIONS

The employment of aircraft on operational areas in
the case of differing surface conditions
A77-22119

S

SAAB 37 AIRCRAFT

Progress report on the Viggen with emphasis on
man-machine design
A77-22008

SAFETY DEVICES

The Mini Boat - A life boat for helicopter crewmen
[ASME PAPER 76-ENAS-61] A77-19502

SANDWICH STRUCTURES

Carbon fibre reinforced plastic sandwich beam
construction in the main wing structure of a man
powered aircraft
[BU-197] N77-17039

SATELLITE NAVIGATION SYSTEMS

New frontiers in aerospace navigation; Proceedings
of the Bicentennial National Aerospace
Symposium, Warminster, Pa., April 27, 28, 1976
A77-20655

Application of the Global Positioning System as an
attitude reference for near-earth users
A77-20675

A navigation algorithm for the low-cost GPS receiver
--- Global Positioning System
A77-20676

SEA LAUNCHING

Navigation for sea based RPVs
A77-20662

SECONDARY RADAR

Radiocommunication in air navigation
A77-21869

SEPARATED FLOW

Fluctuating pressure environment of a drag
reduction spike
[AIAA PAPER 77-90] A77-19819

Numerical solution of axisymmetric boattail flow
fields with plume simulators
[AIAA PAPER 77-224] A77-19909

Incipient separation of leeward flow past a
lifting plate in viscous hypersonic flow
A77-20095

SUBJECT INDEX

SPOILERS

- Nonlinear, unsteady aerodynamic loads on rectangular and delta wings
[AIAA PAPER 77-156] A77-22238
- Laminar separation near the trailing edge of a thin profile
[ESA-TT-343] N77-15996
- An investigation of separation models for the prediction of maximum lift
[AD-A027359] N77-15998
- Laminar separation near the trailing edge of a thin profile
[ONERA-NT-1976-3] N77-16297
- SERVICE LIFE**
The scatter factor in the reliability assessment of aircraft structures A77-20445
- SERVICES**
Winter-related service operations on airports A77-22117
- SERVOCONTROL**
Attitude control of a pilotless aircraft by radioactive probes
[ONERA, TP NO. 1976-112] A77-20867
- SHAFTS (MACHINE ELEMENTS)**
Preproduction test program, Kaflex drive shaft coupling for UH-1 helicopter, phases 8, 9 and 10
[AD-A028202] N77-17044
- SHARP LEADING EDGES**
Pressures over a sharp-edged air intake functioning in subsonic flow at reduced flowrate
[ONERA, TP NO. 1976-127] A77-20870
- SHEAR FLOW**
Effects of inviscid parallel shear flows on steady and unsteady aerodynamics and flutter
[AIAA PAPER 77-158] A77-19864
- SHEAR LAYERS**
Turbulence generated noise on either side of a double layer jet A77-20238
- Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer
[AIAA PAPER 77-157] A77-22239
- SHELL STABILITY**
Deutsche Gesellschaft fuer Luft- und Raumfahrt, Shell Buckling Meeting, Meersburg, West Germany, April 29, 30, 1976, Reports and Discussion Contributions A77-20573
- SHIELDING**
Theoretical and experimental investigation of noise shielding for jet engines --- acoustic and aerodynamic interference measurements
[BMFT-FB-W-76-09] N77-17072
- SHOCK WAVE INTERACTION**
Application of boundary layer blowing to suppress strong shock induced separation in supersonic inlets
[AIAA PAPER 77-147] A77-22235
- Remarks on the suitability of various transonic small perturbation equations to describe three-dimensional transonic flow; examples of computations using a fully-conservative rotated difference scheme --- three typical shock interactions
[NLR-MP-75039-U] N77-15992
- SHOCK WAVE PROPAGATION**
Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions
[AIAA PAPER 77-205] A77-19897
- On the motion of shock waves on an airfoil with oscillating flap in two-dimensional transonic flow
[NLR-TR-75038-U] N77-15994
- SHORT HAUL AIRCRAFT**
Energy considerations in aeronautical transportation /The W. Rupert Turnbull Lecture/ A77-19649
- Operational requirements for flight control and navigation systems for short haul transport aircraft
[NASA-CR-137975] N77-17034
- Flap noise and aerodynamic results for model QCSEB over-the-wing configurations
[NASA-TN-X-73588] N77-17065
- SHORT TAKEOFF AIRCRAFT**
YC-15 development and test highlights A77-22003
- SIGNAL ANALYSIS**
Inter-noise 76; Proceedings of the International Conference on Noise Control Engineering, Washington, D.C., April 5-7, 1976 A77-20629
- SIGNAL PROCESSING**
Aircraft identification by moment invariants A77-21683
- An Extended range Sensor Package (ESP)
[AD-A027850] N77-17025
- SINGULARITY (MATHEMATICS)**
Derivation of an integral equation for transonic flows A77-22685
- SKIN FRICTION**
Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows
[AIAA PAPER 77-92] A77-19821
- SLENDER BODIES**
The turbulent wake behind slender propeller-driven bodies at angle of attack
[AIAA PAPER 77-133] A77-22234
- SLENDER WINGS**
On the not-so-slender wing theory A77-22679
- SMALL PERTURBATION FLOW**
Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions
[AIAA PAPER 77-205] A77-19897
- An approximate calculation of the strong interaction on a transonic airfoil
[AIAA PAPER 77-210] A77-19900
- SNOKE ABATEMENT**
TCM aircraft piston engine emission reduction program N77-17092
- SNOW COVER**
Winter-related service operations on airports A77-22117
- SOLID STATE DEVICES**
RECON 6: A real-time, wide-angle, solid-state reconnaissance camera system for high-speed, low-altitude aircraft N77-17281
- Study and design of flight data recording systems for military aircraft --- Microprocessing flight data for solid state memory storage
[AD-A028862] N77-17446
- SOUND PRESSURE**
Structural acoustic considerations for aircraft A77-20633
- Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113] A77-22228
- SPACECRAFT COMMUNICATION**
Communications with aircraft via satellite A77-21423
- SPACECRAFT COMPONENTS**
Fokker-VFW --- Netherlands space projects A77-20377
- SPANWISE BLOWING**
Augmentation of maneuver performance by spanwise blowing
[NASA-TN-X-73998] N77-15983
- SPARK IGNITION**
Emissions and new technology programs for conventional spark-ignition aircraft engines N77-17096
- SPEED INDICATORS**
Correlation velocity sensor --- aircraft navigation instrument A77-20670
- SPIKES (AERODYNAMIC CONFIGURATIONS)**
Fluctuating pressure environment of a drag reduction spike
[AIAA PAPER 77-90] A77-19819
- SPIN TESTS**
P-5E spin susceptibility test A77-22006
- SPOILERS**
Low speed wind tunnel investigation of flight spoilers as trailing-vortex-alleviation devices on an extended-range wide body tri-jet airplane model
[NASA-TN-D-8373] N77-15982

STABILITY AUGMENTATION

SUBJECT INDEX

STABILITY AUGMENTATION

Dynamics of a slung load

A77-20440

STABILITY DERIVATIVES

Stability derivative measurements with magnetically suspended cone-cylinder models

[AIAA PAPER 77-79] A77-19813

An experiment to measure moment coefficients for aerofoils oscillating in cascade

A77-20145

On aerodynamic coupling between lateral and longitudinal degrees of freedom --- for military flight conditions

[AIAA PAPER 77-4] A77-22206

System identification for nonlinear aerodynamic flight regimes

A77-22708

STABILIZATION

Stabilization, gust alleviation and vibration damping of an elastic aircraft model moving in the wind tunnel

[DLR-FB-76-44] N77-17104

STAGNATION POINT

Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows

[AIAA PAPER 77-92] A77-19821

STAGNATION TEMPERATURE

Influence of fuel temperature on supersonic mixing and combustion of hydrogen

[AIAA PAPER 77-17] A77-19778

STATIC STABILITY

An analytical method for ride quality of flexible airplanes

A77-20080

STATISTICAL ANALYSIS

Predicting the loading of tail planes in the preliminary phase of aircraft design

A77-21874

STEADY FLOW

Nonlinear steady incompressible lifting-surface analysis with wake roll-up

A77-20085

Turbulence generated noise on either side of a double layer jet

A77-20238

STEADY STATE

Investigation of the steady-state behavior of two delta-wing hang gliders

[NASA-TT-F-17394] N77-17031

STEERING

Flight characteristics studies related to the employment of direct power steering in longitudinal motion

[DLR PAPER 76-238] A77-21881

STEREOTELEVISION

Terrain following using stereo television

N77-16056

STOPPING

Application of dimensional analysis to predict airplane stopping distance

A77-20446

STRAPDOWN INERTIAL GUIDANCE

Advanced development program for the ring laser gyro navigator --- for strapdown inertial system application

A77-20663

A modular fail op fail safe strapped-down navigator

A77-20665

STRESS ANALYSIS

Thermo-mechanical stress analysis of advanced turbine blade cooling configuration

[AD-A027718] N77-16066

STRUCTURAL ANALYSIS

Composite hubs for low cost gas turbine engines

[NASA-TN-X-73578] N77-17066

STRUCTURAL DESIGN CRITERIA

Structures and materials --- for future aircraft design

A77-20718

STRUCTURAL FAILURE

The scatter factor in the reliability assessment of aircraft structures

A77-20445

Structural acoustic considerations for aircraft

A77-20633

STRUCTURAL VIBRATION

Prediction of the angular vibration of aircraft structures

A77-19977

Methods and techniques of vibration testing in flight

[ONERA, TP NO. 1976-120] A77-20868

STRUCTURAL WEIGHT

Predicting the loading of tail planes in the preliminary phase of aircraft design

A77-21874

SUBSONIC AIRCRAFT

Nacelle installation analysis for subsonic transport aircraft

[AIAA PAPER 77-102] A77-22227

SUBSONIC FLOW

Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows

A77-19742

Computation of low speed flow about an asymmetric nacelle at incidence

[AIAA PAPER 77-143] A77-19857

An inviscid model for submerged transonic wall jets

[AIAA PAPER 77-174] A77-19875

Penetration and break-up of liquid fuel jets in high subsonic speed airstreams

[AIAA PAPER 77-201] A77-19893

Unsteady aerodynamic forces in a rectilinear cascade of subsonic blades

[ONERA, TP NO. 1976-78] A77-20143

Pressures over a sharp-edged air intake functioning in subsonic flow at reduced flowrate

[ONERA, TP NO. 1976-127] A77-20870

A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations

[AIAA PAPER 77-1] A77-22205

A subsonic flow investigation on a research body at high angles of attack

[AIAA PAPER 77-180] A77-22240

Pressure distribution on a 1- by 3-meter semispan wing at sweep angles from 0 deg to 40 deg in subsonic flow

[NASA-TN-D-8307] N77-15979

Variable-area subsonic diffuser study

[AD-A029352] N77-16067

SUBSONIC FLUTTER

Investigation of blade flutter in a subsonic turbine cascade

A77-20142

Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer

[AIAA PAPER 77-157] A77-22239

SUPERCRITICAL WINGS

Hodograph theory and shock free airfoils

[NLR-MP-76002-U] N77-15993

SUPERSONIC AIRCRAFT

Transonic performance of an auxiliary airflow system for axisymmetric inlets

[AIAA PAPER 77-148] A77-19860

Operational problems of supersonic aircraft

A77-22116

SUPERSONIC COMBUSTION

Influence of fuel temperature on supersonic mixing and combustion of hydrogen

[AIAA PAPER 77-17] A77-19778

SUPERSONIC COMBUSTION RAMJET ENGINES

Scramjet exhaust simulation technique for hypersonic aircraft nozzle design and aerodynamic tests

[AIAA PAPER 77-82] A77-19815

A forebody design technique for highly integrated bottom-mounted scramjets with application to a hypersonic research airplane

[NASA-TN-D-8369] N77-16019

SUPERSONIC COMPRESSORS

Flow instability in supersonic compressors in the regime of low compression rate

[ONERA, TP NO. 1976-71] A77-20151

SUPERSONIC FLOW

Effect of a conical break in delta wings on aerodynamic characteristics

A77-19733

Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows

A77-19742

SUBJECT INDEX

TEFLON (TRADEMARK)

Investigation of supersonic flow past elongated blunt bodies of elliptical cross section A77-19744

Advanced techniques for computation of supersonic flow
[AIAA PAPER 77-173] A77-19874

On the analysis of the aerodynamic and flutter characteristics of transonic compressor blades A77-20139

Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113] A77-22228

Supersonic pressure measurements and comparison of theory to experiment for an arrow-wing configuration
[NASA-CR-145046] N77-17000

SUPERSONIC FLUTTER
Some recent developments in unsteady aerodynamics of a supersonic cascade A77-20138

Flow instability in supersonic compressors in the regime of low compression rate
[ONERA, TP NO. 1976-71] A77-20151

SUPERSONIC INLETS
Application of boundary layer blowing to suppress strong shock induced separation in supersonic inlets
[AIAA PAPER 77-147] A77-22235

SUPERSONIC NOZZLES
Calculation of base pressure in ejector nozzles of different length for the case of a zero ejection coefficient A77-19747

SUPERSONIC TRANSPORTS
Oblique wing transonic transport configuration development
[NASA-CR-151928] N77-17037

Development of technology for the fabrication of reliable laminar flow control panels on subsonic transports
[NASA-CR-145125] N77-17038

SUPERSONIC WAKES
Calculation of supersonic laminar flow about a blunt body and the flow in the wake A77-22934

SURFACE ROUGHNESS EFFECTS
The employment of aircraft on operational areas in the case of differing surface conditions A77-22119

SURVEILLANCE
Skyspy - A ducted RPV fan A77-20627

SURVEILLANCE RADAR
Radiocommunication in air navigation A77-21869

SURVIVAL EQUIPMENT
The Mini Boat - A life boat for helicopter crewmen
[ASME PAPER 76-ENAS-61] A77-19502

SWEEP EFFECT
Pressure distribution on a 1- by 3-meter semispan wing at sweep angles from 0 deg to 40 deg in subsonic flow
[NASA-TN-D-8307] N77-15979

SWEEP WINGS
Three-dimensional turbulent boundary layer calculations for swept wings
[AIAA PAPER 77-3] A77-19765

Flow survey behind wings
[AIAA PAPER 77-175] A77-19876

Lateral equilibrium of asymmetrical swept wings - Aileron control vs geometric twist A77-20441

A brief description of the Jameson-Caughey NYU transonic swept-wing computer program: FLO 22
[NASA-TN-X-73996] N77-15977

Pressure distribution on a 1- by 3-meter semispan wing at sweep angles from 0 deg to 40 deg in subsonic flow
[NASA-TN-D-8307] N77-15979

Effects of wing leading-edge radius and Reynolds number on longitudinal aerodynamic characteristics of highly swept wing-body configurations at subsonic speeds
[NASA-TN-D-8361] N77-15980

SWEEPBACK WINGS
Design and analysis of winglets for military aircraft
[AD-A029345] N77-17040

SYSTEM EFFECTIVENESS
Error model of an inertial navigation system for integrated navigation based on adjustment according to the method of least squares A77-20652

The employment of aircraft on operational areas in the case of differing surface conditions A77-22119

SYSTEMS ANALYSIS
Remotely piloted vehicles - The influence of system thinking on applied technology A77-20622

SYSTEMS ENGINEERING
Simulation analysis of a microcomputer-based, low-cost omega navigation system A77-20674

An analysis of an application of aerospace systems engineering process as it affects design N77-16012

T

T-39 AIRCRAFT
Wind tunnel and ground static tests of a .094 scale powered model of a modified T-39 lift/cruise fan V/STOL research airplane
[NASA-CR-151923] N77-17036

TABLES (DATA)
Single stage, low noise, advanced technology fan. Volume 4: Fan aerodynamics. Section 2: Overall and blade element performance data tabulations
[NASA-CR-134893] N77-17061

TARGET SIMULATORS
Research on smart target for aerial combat. Part 1: General description
[AD-A029171] N77-17050

Research on smart target for aerial combat. Part 2: Technical description
[AD-A029172] N77-17051

Research on smart target for aerial combat. Part 3: Interface documentation
[AD-A029173] N77-17052

TECHNOLOGICAL FORECASTING
Aerodynamic design --- future aircraft design factors A77-20716

Structures and materials --- for future aircraft design A77-20718

Precision DME for future landing systems - One solution A77-21421

Alternative general-aircraft engines N77-17097

TECHNOLOGY ASSESSMENT
Aircraft design 40 years after Juan de la Cierva A77-21324

The aero engine and its progress - Fifty years after Griffith --- gas turbine development and technology assessment A77-21594

Follow-on studies for design definition of a lift/cruise fan technology V/STOL airplane, volume 1
[NASA-CR-137976] N77-17035

TECHNOLOGY UTILIZATION
Remotely piloted vehicles - An Air Force view A77-20619

Tactical air applications for advanced multisensor imagery processing and display techniques A77-22738

Emissions and new technology programs for conventional spark-ignition aircraft engines N77-17096

On the applicability of integrated circuit technology to general aviation orientation estimation
[NASA-CR-151952] N77-17356

TESTING
Maximum rotor thrust capabilities, articulated and teetering rotors A77-22668

TEFLON (TRADEMARK)
Teflon airframe bearings - Their advantages and limitations A77-22146

TELECOMMUNICATION

SUBJECT INDEX

TELECOMMUNICATION

The new UTC Time Signals --- Coordinated Universal Time
A77-20658

TELEVISION CAMERAS

RECON 6: A real-time, wide-angle, solid-state reconnaissance camera system for high-speed, low-altitude aircraft
N77-17281

TEMPERATURE CONTROL

Cooling methods for aircraft electronics equipment [ASME PAPER 76-ENAS-51]
A77-19492

TEMPERATURE EFFECTS

Influence of fuel temperature on supersonic mixing and combustion of hydrogen
[AIAA PAPER 77-17]
A77-19778
Summary report on effects at temperature, humidity, and fuel-air ratio on two air-cooled light aircraft engines
N77-17086

TERMINAL FACILITIES

Automated Terminal Service --- for airport tower installation
A77-20668

TERMINAL GUIDANCE

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results
[AD-A029051]
N77-16071

TERRAIN FOLLOWING AIRCRAFT

Terrain following using stereo television
N77-16056

TEST EQUIPMENT

Testing equipment available in France for studying aircraft and engine noise
A77-21887

TEST FACILITIES

Interface definition DABS engineering model/ATC (NAFEC) terminal hardware configuration, volume 4
[AD-A025234/6]
N77-16007

THIN AIRFOILS

Derivation of an integral equation for transonic flows
A77-22685

THIN PLATES

Incipient separation of leeward flow past a lifting plate in viscous hypersonic flow
A77-20095

THIN WALLED SHELLS

Deutsche Gesellschaft fuer Luft- und Raumfahrt, Shell Buckling Meeting, Meersburg, West Germany, April 29, 30, 1976, Reports and Discussion Contributions
A77-20573

THIN WINGS

Laminar separation near the trailing edge of a thin profile
[ESA-TT-343]
N77-15996
Laminar separation near the trailing edge of a thin profile
[ONERA-NT-1976-3]
N77-16297

THREE DIMENSIONAL BOUNDARY LAYER

Three-dimensional turbulent boundary layer calculations for swept wings
[AIAA PAPER 77-3]
A77-19765

THREE DIMENSIONAL FLOW

Study of the effect of nozzle shape on the characteristics of three-dimensional subsonic and supersonic flows
A77-19742
Investigation of supersonic flow past elongated blunt bodies of elliptical cross section
A77-19744
Flow measurements in leading edge vortices
[AIAA PAPER 77-11]
A77-19772
An experimental and numerical study of the 3-D mixing flows of a turbofan engine exhaust system
[AIAA PAPER 77-204]
A77-19896
Calculation of transonic wing flows by grid embedding
[AIAA PAPER 77-207]
A77-19899
A numerical technique for subsonic flows past three dimensional canard-wing configurations with edge separations
[AIAA PAPER 77-1]
A77-22205

Nacelle installation analysis for subsonic transport aircraft
[AIAA PAPER 77-102]
A77-22227

Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings
[AIAA PAPER 77-209]
A77-22244

THRUST

Maximum rotor thrust capabilities, articulated and teetering rotors
A77-22668

THRUST CONTROL

Optimal control of thrust and angle of attack of an aircraft performing a climb-acceleration maneuver
A77-19329

THRUST VECTOR CONTROL

Lift/cruise fan V/STOL technology aircraft design definition study. Volume 3: Development program and budgetary estimates
[NASA-CR-151933]
N77-16015

TIME DEPENDENCE

Propelled time-dependent forces due to nonuniform inflow
N77-16060

TIME DIVISION MULTIPLEXING

Evaluation of the accuracy of community relative navigation organization concepts
A77-20656

TIME LAG

Three frequency difference OMEGA
A77-20673

TIME MEASUREMENT

Characteristic time correlation of emissions from conventional aircraft type flames
[PB-258269/0]
N77-17078

TIME SIGNALS

The new UTC Time Signals --- Coordinated Universal Time
A77-20658

TITANIUM ALLOYS

Evaluation of isothermal forgings for T53 impellers
[AD-A030469]
N77-17227

TORSION

Nonlinear curvature expressions for combined flapwise bending, chordwise bending, torsion and extension of twisted rotor blades
[NASA-TN-X-73997]
N77-16376

TORSIONAL VIBRATION

Comparison between theoretical and experimental results of torsional stall flutter of an airfoil
A77-20140
Experimental and theoretical investigations of the aerodynamic damping of turbojet rotor blade vibrations
A77-20141

An experiment to measure moment coefficients for aerofoils oscillating in cascade
A77-20145

Stall flutter and nonlinear divergence of a two-dimensional flat plate wing
A77-20146

TOWED BODIES

Flight test development of a helicopter-towed surface delivery
[AD-A028637]
N77-17042

TOWING

Dynamics of a slung load
A77-20440

TRADEOFFS

Advanced helicopter designs
A77-20720

TRAILING EDGES

Pressure distribution on the trailing edge of a semi-infinite airfoil oscillating in a shear layer
[AIAA PAPER 77-157]
A77-22239

Low speed wind tunnel investigation of flight spoilers as trailing-vortex-alleviation devices on an extended-range wide body tri-jet airplane model
[NASA-TN-D-8373]
N77-15982

Laminar separation near the trailing edge of a thin profile
[ESA-TT-343]
N77-15996

Laminar separation near the trailing edge of a thin profile
[ONERA-NT-1976-3]
N77-16297

TRAILING-EDGE FLAPS

A nonlinear theory for airfoils with trailing-edge jet flap
[NASA-TN-D-8368] N77-15981

On the motion of shock waves on an airfoil with oscillating flap in two-dimensional transonic flow
[NLR-TR-75038-U] N77-15994

TRAINING AIRCRAFT

Practical aerodynamics of the Yak-18T airplane --- Russian book
A77-22450

TRANSITION FLOW

Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113] A77-22228

TRANSONIC COMPRESSORS

On the analysis of the aerodynamic and flutter characteristics of transonic compressor blades
A77-20139

Flow instability in supersonic compressors in the regime of low compression rate
[ONERA, TP NO. 1976-71] A77-20151

Effects of tip clearance on overall performance of transonic fan stage with and without casing treatment
[NASA-TM-X-3479] N77-16992

TRANSONIC FLOW

Investigation of strongly underexpanded submerged jets
A77-19743

Transonic performance of an auxiliary airflow system for axisymmetric inlets
[AIAA PAPER 77-148] A77-19860

An inviscid model for submerged transonic wall jets
[AIAA PAPER 77-174] A77-19875

Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions
[AIAA PAPER 77-205] A77-19897

Calculation of transonic wing flows by grid embedding
[AIAA PAPER 77-207] A77-19899

An approximate calculation of the strong interaction on a transonic airfoil
[AIAA PAPER 77-210] A77-19900

Analytical study of viscous effects on transonic flow over boattail nozzles
[AIAA PAPER 77-223] A77-19908

On the analysis of the aerodynamic and flutter characteristics of transonic compressor blades
A77-20139

Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings
[AIAA PAPER 77-209] A77-22244

Prediction of pressure distributions on axisymmetric bodies in transonic flow
[AIAA PAPER 77-226] A77-22248

On the not-so-slender wing theory
A77-22679

Derivation of an integral equation for transonic flows
A77-22685

A brief description of the Jameson-Caughey NYU transonic swept-wing computer program: PLO 22
[NASA-TM-X-73996] N77-15977

Review of the application of hodograph theory to transonic aerofoil design and theoretical and experimental analysis of shock-free aerofoils --- noting pressure distributions
[NLR-MP-75033-U] N77-15991

Remarks on the suitability of various transonic small perturbation equations to describe three-dimensional transonic flow; examples of computations using a fully-conservative rotated difference scheme --- three typical shock interactions
[NLR-MP-75039-U] N77-15992

Transonic rotor aerodynamics: Fundamentals of the theory
[NASA-TT-F-17395] N77-16990

TRANSONIC FLUTTER

A study on choking flutter
A77-20148

TRANSONIC NOZZLES

An evaluation of jet simulation parameters for nozzle/afterbody testing at transonic Mach numbers
[AIAA PAPER 77-106] A77-19830

TRANSONIC WIND TUNNELS

Transonic wind-tunnel tests of a lifting parachute model
[NASA-TM-X-73982] N77-15987

TRANSPORT AIRCRAFT

Airframe noise of component interactions on a large transport model
[AIAA PAPER 77-57] A77-19801

Investigation into the optimum use of advanced displays in future transport aircraft
A77-20606

Nacelle installation analysis for subsonic transport aircraft
[AIAA PAPER 77-102] A77-22227

Safety of transport aircraft
[BHPT-FB-W-76-07] N77-17019

Transport airplane flight deck development survey and analysis: Report and recommendations
[NASA-CR-145121] N77-17030

Oblique wing transonic transport configuration development
[NASA-CR-151928] N77-17037

TRANSPORTATION ENERGY

Energy considerations in aeronautical transportation /The W. Rupert Turnbull Lecture/
A77-19649

TU-144 AIRCRAFT

Operational problems of supersonic aircraft
A77-22116

TURBINE BLADES

Flow in turbomachines with nonuniform inlet velocity distribution
A77-19708

Investigation of blade flutter in a subsonic turbine cascade
A77-20142

Experimental aeroelastic investigations on a cascade in compressible flow
A77-20147

Fatigue of gas-turbine blades made of heat-resistant casting alloys
A77-22266

Thermo-mechanical stress analysis of advanced turbine blade cooling configuration
[AD-A027718] N77-16066

TURBINE ENGINES

Ambient temperature and humidity correction factors for exhaust emissions from two classes of aircraft turbine engines
[AD-A031923/6] N77-16064

TURBINE PUMPS

Development of a retractable vane starting pump integrated within a vapor core fuel pump. Turbine engine technology demonstrator component development program, project 668A. Controls development program (part 5)
[AD-A029032] N77-17076

TURBOCOMPRESSORS

Detailed measurements of the periodically unsteady flow produced by rotor and stator wake interaction in a multistage turbomachine
[AIAA PAPER 77-202] A77-19894

On the unsteady aerodynamic rotor blade loading in a transonic axial flow compressor with steady-state inlet distortion
A77-20153

Internal flow characteristics of a multistage compressor with inlet pressure distortion --- J85-13 turbojet engine studies
[NASA-TM-X-3446] N77-17070

TURBOFAN ENGINES

An experimental and numerical study of the 3-D mixing flows of a turbofan engine exhaust system
[AIAA PAPER 77-204] A77-19896

Core noise measurements on a YP-102 turbofan engine
[AIAA PAPER 77-21] A77-19981

Variable-area subsonic diffuser study
[AD-A029352] N77-16067

Aerodynamic and acoustic tests of duct-burning turbofan exhaust nozzles
[NASA-CR-2628] N77-16986

Core noise measurements on a YP-102 turbofan engine
[NASA-TM-X-73587] N77-17064

TURBOFANS

SUBJECT INDEX

- Development of a retractable vane starting pump integrated within a vapor core fuel pump.
Turbine engine technology demonstrator component development program, project 668A. Controls development program (part 5)
[AD-A029032] N77-17076
- TURBOFANS**
The 727/JT8D jet and fan noise flight effects study
[AD-A031877/4] N77-16063
Reverse pitch fan with divided splitter
[NASA-CASE-LEW-12760-1] N77-17059
Single-stage, low-noise, advanced technology fan.
Volume 4: Fan aerodynamics. Section 1: Results and analysis
[NASA-CR-134892] N77-17060
Single stage, low noise, advanced technology fan.
Volume 4: Fan aerodynamics. Section 2: Overall and blade element performance data tabulations
[NASA-CR-134893] N77-17061
- TURBOJET ENGINES**
An evaluation of jet simulation parameters for nozzle/afterbody testing at transonic Mach numbers
[AIAA PAPER 77-106] A77-19830
Experimental and theoretical investigations of the aerodynamic damping of turbojet rotor blade vibrations
A77-20141
Techniques employed in analyzing turbojet noise
A77-21893
- TURBOMACHINE BLADES**
Comparison between theoretical and experimental results of torsional stall flutter of an airfoil
A77-20140
An experiment to measure moment coefficients for aerofoils oscillating in cascade
A77-20145
- TURBOMACHINERY**
The development of flow boundary layers in turbomachines
A77-20086
Symposium on Aeroelasticity in Turbomachines, Ecole Nationale Supérieure de Techniques Avancées, Paris, France, October 18-23, 1976, Proceedings
A77-20129
Preliminary reflections on the problems of aeroelasticity in turbomachines
A77-20131
- TURBULENCE EFFECTS**
Turbulence generated noise on either side of a double layer jet
A77-20238
- TURBULENT BOUNDARY LAYER**
Three-dimensional turbulent boundary layer calculations for swept wings
[AIAA PAPER 77-3] A77-19765
Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[AIAA PAPER 77-144] A77-19983
The development of flow boundary layers in turbomachines
A77-20086
Surface pressure fluctuation measurements in attached transitional/turbulent boundary layers at supersonic and hypersonic speeds
[AIAA PAPER 77-113] A77-22228
An investigation of separation models for the prediction of maximum lift
[AD-A027359] N77-15998
A general method for calculating three-dimensional compressible laminar and turbulent boundary layers on arbitrary wings
[NASA-CR-2777] N77-16994
Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[NASA-TN-X-73575] N77-17063
- TURBULENT FLOW**
A general theory of turbulent combustion - The Lagrangian aspects
[AIAA PAPER 77-141] A77-19855
Numerical solution of axisymmetric boattail flow fields with plume simulators
[AIAA PAPER 77-224] A77-19909
On some structure-turbulence interaction problems
[NASA-CR-149461] N77-15986
- TURBULENT JETS**
Jet noise source modification due to forward flight
[AIAA PAPER 77-58] A77-22215
- TURBULENT WAKES**
The turbulent wake behind slender propeller-driven bodies at angle of attack
[AIAA PAPER 77-133] A77-22234
Vortex interactions and decay in aircraft wakes
A77-22678
- TWISTING**
Static aeroelastic twist effects on helicopter rotor-induced velocity
A77-20448
- TWO DIMENSIONAL BOUNDARY LAYER**
The development of flow boundary layers in turbomachines
A77-20086
- TWO DIMENSIONAL FLOW**
Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows
[AIAA PAPER 77-92] A77-19821
Unsteady aerodynamic forces acting on loaded two-dimensional blades in nonuniform incompressible flows
A77-20137
On the motion of shock waves on an airfoil with oscillating flap in two-dimensional transonic flow
[NLR-TR-75038-U] N77-15994
- U**
- UH-1 HELICOPTER**
A launch transient experiment for imaging seekers
[AD-A028625] N77-16049
Preproduction test program, Kaflex drive shaft coupling for UH-1 helicopter, phases 8, 9 and 10
[AD-A028202] N77-17044
Vibration measurements on the rotor shaft of the UH-1 helicopter
[AD-A028924] N77-17047
- ULTRAHIGH FREQUENCIES**
Precision DME for future landing systems - One solution
A77-21421
- UNIVERSAL TIME**
The new UTC Time Signals --- Coordinated Universal Time
A77-20658
- UNSTEADY FLOW**
Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight
[AIAA PAPER 77-5] A77-19766
Detailed measurements of the periodically unsteady flow produced by rotor and stator wake interaction in a multistage turbomachine
[AIAA PAPER 77-202] A77-19894
Implicit finite-difference computations of unsteady transonic flows about airfoils, including the treatment of irregular shock-wave motions
[AIAA PAPER 77-205] A77-19897
The development of flow boundary layers in turbomachines
A77-20086
Some recent developments in unsteady aerodynamics of a supersonic cascade
A77-20138
Investigation of blade flutter in a subsonic turbine cascade
A77-20142
- USER MANUALS (COMPUTER PROGRAMS)**
REXOR rotorcraft simulation. Volume 3: User's manual
[AD-A028417] N77-17054
- USER REQUIREMENTS**
Operational requirements for advanced fighter aircrew displays
A77-22728
- V**
- V/STOL AIRCRAFT**
Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[AIAA PAPER 77-144] A77-19983
The Aerodyne - An R.P.V. with multiple capability
A77-20626
Skyspy - A ducted RPV fan
A77-20627

SUBJECT INDEX

WEAR TESTS

Lift/cruise fan V/STOL technology aircraft design definition study. Volume 1: Technology flight vehicle definition
[NASA-CR-151931] N77-16013

Lift/cruise fan V/STOL technology aircraft design definition study. Volume 2: Propulsion transmission system design
[NASA-CR-151932] N77-16014

Lift/cruise fan V/STOL technology aircraft design definition study. Volume 3: Development program and budgetary estimates
[NASA-CR-151933] N77-16015

Flow effects at cross blown lifting jets of V/STOL aircraft and their reaction on aerodynamic forces and moments of the nacelle
[DLR-FB-76-34] N77-17008

Follow-on studies for design definition of a lift/cruise fan technology V/STOL airplane, volume 1
[NASA-CR-137976] N77-17035

Wind tunnel and ground static tests of a .094 scale powered model of a modified T-39 lift/cruise fan V/STOL research airplane
[NASA-CR-151923] N77-17036

Prediction of laminar and turbulent boundary layer flow separation in V/STOL engine inlets
[NASA-TN-X-73575] N77-17063

VELOCITY DISTRIBUTION
Flow in turbomachines with nonuniform inlet velocity distribution
A77-19708

Propelled time-dependent forces due to nonuniform inflow
N77-16060

VELOCITY ERRORS
Dual INS velocity error reduction through new damping techniques
A77-20678

VELOCITY MEASUREMENT
Correlation velocity sensor --- aircraft navigation instrument
A77-20670

VERTICAL TAKEOFF AIRCRAFT
Vertical takeoff lift augmentation - The 'sculptured deck' concept
A77-20439

VTOL landing aid using low-frequency near-field techniques
A77-20672

VHF OMNIRANGE NAVIGATION
Experience with the VOR navigation system in the German Democratic Republic. II
A77-22118

VIBRATION DAMPING
Experimental and theoretical investigations of the aerodynamic damping of turbojet rotor blade vibrations
A77-20141

Investigation of blade flutter in a subsonic turbine cascade
A77-20142

Dynamics of a slung load
A77-20440

Stabilization, gust alleviation and vibration damping of an elastic aircraft model moving in the wind tunnel
[DLR-FB-76-44] N77-17104

VIBRATION EFFECTS
Application of a modified complementary filtering technique for increased aircraft control system frequency bandwidth in high vibration environment
[NASA-TN-X-74004] N77-17103

VIBRATION MEASUREMENT
Vibration measurements on the rotor shaft of the UH-1 helicopter
[AD-A028924] N77-17047

VIBRATION MODE
Prediction of the angular vibration of aircraft structures
A77-19977

VIBRATION TESTS
Methods and techniques of vibration testing in flight
[ONERA, TP NO. 1976-120] A77-20868

Vibration tests on aircraft engines
A77-22260

VISCOUS FLOW
Viscous perturbation effects on hypersonic unsteady aerodynamics --- tactical missile flight
[AIAA PAPER 77-5] A77-19766

Analytical study of viscous effects on transonic flow over boattail nozzles
[AIAA PAPER 77-223] A77-19908

Incipient separation of leeward flow past a lifting plate in viscous hypersonic flow
A77-20095

Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings
[AIAA PAPER 77-209] A77-22244

An investigation of separation models for the prediction of maximum lift
[AD-A027359] N77-15998

VISIBILITY
An evaluation of window glass for air traffic control tower cabs
[AD-A031924/4] N77-16171

VISUAL AIDS
Electronic head-up display at pilot's eye level
[NASA-TT-P-17390] N77-17058

VORTEX STREETS
Vortex streets in the wakes of subsonic and transonic turbine cascades
A77-20154

A theoretical investigation of laminar wakes behind airfoils and the resulting noise pattern
A77-22045

VORTICES
Flow measurements in leading edge vortices
[AIAA PAPER 77-11] A77-19772

Effects of vorticity amplification in two-dimensional and axisymmetric stagnation-point flows
[AIAA PAPER 77-92] A77-19821

Flow survey behind wings
[AIAA PAPER 77-175] A77-19876

Vortex interactions and decay in aircraft wakes
A77-22678

Low speed wind tunnel investigation of flight spoilers as trailing-vortex-alleviation devices on an extended-range wide body tri-jet airplane model
[NASA-TN-D-8373] N77-15982

Numerical solutions of Navier-Stokes equations for the structure of a trailing vortex
[NASA-TN-X-73361] N77-16993

W

WAKES
Self-similar representation of the structure of the gasdynamic region during discharge of a highly underexpanded gas jet into a hypersonic wake flow
A77-19732

Investigation of the size of the wake of a cone flying at hypersonic speed
A77-19746

Analysis of unsteady airloads of helicopter rotors in hover
[AIAA PAPER 77-159] A77-19865

Detailed measurements of the periodically unsteady flow produced by rotor and stator wake interaction in a multistage turbomachine
[AIAA PAPER 77-202] A77-19894

Vortex streets in the wakes of subsonic and transonic turbine cascades
A77-20154

WALL JETS
An inviscid model for submerged transonic wall jets
[AIAA PAPER 77-174] A77-19875

WARNING SYSTEMS
Flight information for airline pilots - The certification angle
A77-20605

WEAPON SYSTEMS
An analysis of an application of aerospace systems engineering process as it affects design
N77-16012

WEAR TESTS
Teflon airframe bearings - Their advantages and limitations
A77-22146

WIND TUNNEL CALIBRATION

WIND TUNNEL CALIBRATION

Wind tunnel test and calibration techniques for the measurement of damping and dynamic cross derivatives due to pitching and yawing
[AIAA PAPER 77-80] A77-22221

WIND TUNNEL MODELS

Airframe noise measurements by acoustic imaging
[AIAA PAPER 77-55] A77-19799
Reynolds number and nozzle afterbody configuration effects on model forebody and afterbody drag
[AIAA PAPER 77-103] A77-19827
Prediction of pressure distributions on axisymmetric bodies in transonic flow
[AIAA PAPER 77-226] A77-22248
Stabilization, gust alleviation and vibration damping of an elastic aircraft model moving in the wind tunnel
[DLR-FB-76-44] N77-17104

WIND TUNNEL TESTS

Fluctuating pressure environment of a drag reduction spike
[AIAA PAPER 77-90] A77-19819
Transonic performance of an auxiliary airflow system for axisymmetric inlets
[AIAA PAPER 77-148] A77-19860
Flow survey behind wings
[AIAA PAPER 77-175] A77-19876
Unsteady pressures on a harmonically oscillating staggered cascade in incompressible and compressible flow
A77-20144
Experimental aeroelastic investigations on a cascade in compressible flow
A77-20147
Dynamics of a slung load
A77-20440

Wind tunnel test and calibration techniques for the measurement of damping and dynamic cross derivatives due to pitching and yawing
[AIAA PAPER 77-80] A77-22221
A subsonic flow investigation on a research body at high angles of attack
[AIAA PAPER 77-180] A77-22240
A wing for the Airbus
A77-22662

Transonic wind-tunnel tests of a lifting parachute model
[NASA-TM-X-73982] N77-15987
Lift/cruise fan V/STOL technology aircraft design definition study. Volume 3: Development program and budgetary estimates
[NASA-CR-151933] N77-16015
Comparison of two methods used to measure aerodynamic loads acting on captive store models in wind tunnel tests
[AD-A030208] N77-17016
Wind tunnel and ground static tests of a .094 scale powered model of a modified T-39 lift/cruise fan V/STOL research airplane
[NASA-CR-151923] N77-17036
The effect of forward speed on J85 engine noise from suppressor nozzles as measured in the NASA-Ames 40- by 80-foot wind tunnel
[NASA-TN-D-8426] N77-17068

WINDOWS

An evaluation of window glass for air traffic control tower cabs
[AD-A031924/4] N77-16171

WING FLAPS

Flap noise and aerodynamic results for model QCSEE over-the-wing configurations --- Quiet Clean Short-aaul Experimental Engine program
[AIAA PAPER 77-23] A77-19982
Flap noise and aerodynamic results for model QCSEE over-the-wing configurations
[NASA-TM-X-73588] N77-17065

WING LOADING

A numerical method for the exact calculation of airloads associated with impulsively started wings
[AIAA PAPER 77-2] A77-19764
Flow survey behind wings
[AIAA PAPER 77-175] A77-19876
Advanced helicopter designs
A77-20720
Nonlinear, unsteady aerodynamic loads on rectangular and delta wings
[AIAA PAPER 77-156] A77-22238

SUBJECT INDEX

WING OSCILLATIONS

On the motion of shock waves on an airfoil with oscillating flap in two-dimensional transonic flow
[NLR-TR-75038-U] N77-15994

WING PANELS

Advanced composites manufacturing as influenced by design --- for A-7D aircraft outer wing panel
A77-22145

WING PLANFORMS

Stall flutter and nonlinear divergence of a two-dimensional flat plate wing
A77-20146
Investigations related to the inviscid-viscous interaction in transonic flows about finite 3-D wings
[AIAA PAPER 77-209] A77-22244
Lifting surface theory for wings of arbitrary planform
[AD-A028449] N77-16000
Theoretical parametric study of the relative advantages of winglets and wing-tip extensions
[NASA-TM-X-74003] N77-16989

WING PROFILES

A wing for the Airbus
A77-22662
Effects of wing leading-edge radius and Reynolds number on longitudinal aerodynamic characteristics of highly swept wing-body configurations at subsonic speeds
[NASA-TN-D-8361] N77-15980

WING ROOTS

Theoretical parametric study of the relative advantages of winglets and wing-tip extensions
[NASA-TM-X-74003] N77-16989

WING TIPS

Nonlinear, unsteady aerodynamic loads on rectangular and delta wings
[AIAA PAPER 77-156] A77-22238
Theoretical parametric study of the relative advantages of winglets and wing-tip extensions
[NASA-TM-X-74003] N77-16989
Design and analysis of winglets for military aircraft
[AD-A029345] N77-17040

WING-FUSELAGE STORES

The technical concept of the IL-62M. II - Fuel system
A77-22120

WINGS

Remarks on the suitability of various transonic small perturbation equations to describe three-dimensional transonic flow; examples of computations using a fully-conservative rotated difference scheme --- three typical shock interactions
[NLR-MP-75039-U] N77-15992
A general method for calculating three-dimensional compressible laminar and turbulent boundary layers on arbitrary wings
[NASA-CR-2777] N77-16994

X

X-22 AIRCRAFT

A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results
[AD-A029051] N77-16071
A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 2: Background information and supporting data
[AD-A028874] N77-16072

Y

YAW

On aerodynamic coupling between lateral and longitudinal degrees of freedom --- for military flight conditions
[AIAA PAPER 77-4] A77-22206
Wind tunnel test and calibration techniques for the measurement of damping and dynamic cross derivatives due to pitching and yawing
[AIAA PAPER 77-80] A77-22221

SUBJECT INDEX

Z-37 AIRCRAFT

YC-14 AIRCRAFT

Electrical flight control for Boeing YC-14 A77-20006

YC-14 flight test progress report A77-22002

YP-16 AIRCRAFT

Flight testing the fighter CCV A77-22007

Z

Z-37 AIRCRAFT

The propulsion system of the aircraft Z-37. I A77-22121

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl 83)

MAY 1977

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g. NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g. N77 11063. Under any one author's name the accession numbers are arranged in sequence with the JAA accession numbers appearing first.

A

- ABBOTT, T. S.**
Application of a modified complementary filtering technique for increased aircraft control system frequency bandwidth in high vibration environment [NASA-TN-X-74004] N77-17103
- ABRAMOVICH, G. N.**
Applied gasdynamics /4th revised edition/ A77-20123
- AIKEN, E. W.**
A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 1: Technical discussion and results [AD-A029051] N77-16071
A flight investigation of control, display, and guidance requirements for decelerating descending VTOL instrument transitions using the X-22A variable stability aircraft. Volume 2: Background information and supporting data [AD-A028874] N77-16072
- AL-AGHA, H. B.**
Carbon fibre reinforced plastic sandwich beam construction in the main wing structure of a man powered aircraft [BG-197] N77-17039
- ALEKSANDROV, A. G.**
Inspection of the working order of airplanes and helicopters: Handbook A77-22541

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Special Bibliography (Suppl 83)

MAY 1977

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the IAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the IAA or STAR section.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

Carnegie Library of Pittsburgh

WASHINGTON

University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries:

CALIFORNIA

Los Angeles Public Library

San Diego Public Library

COLORADO

Denver Public Library

CONNECTICUT

Hartford Public Library

MARYLAND

Enoch Pratt Free Library, Baltimore

MASSACHUSETTS

Boston Public Library

MICHIGAN

Detroit Public Library

MINNESOTA

Minneapolis Public Library

MISSOURI

Kansas City Public Library

St. Louis Public Library

NEW JERSEY

Trenton Public Library

NEW YORK

Brooklyn Public Library

Buffalo and Erie County Public Library

Rochester Public Library

New York Public Library

OHIO

Akron Public Library

Cincinnati Public Library

Cleveland Public Library

Dayton Public Library

Toledo Public Library

OKLAHOMA

Oklahoma County Libraries, Oklahoma City

TENNESSEE

Memphis Public Library

TEXAS

Dallas Public Library

Fort Worth Public Library

WASHINGTON

Seattle Public Library

WISCONSIN

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "*" and "#", from ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.
